Description

[0001] The present invention relates to fusion partners which act as immunological fusion partners, as expression enhancers, and preferably to fusion partners having both functions. The invention also relates to fusion proteins containing them, to their manufacture, to their use in vaccines and to their use in medicines. In particular fusion partners are provided that contain a so-called choline binding domain, for example fusions comprising LytA from *Streptococcus pneumoniae*, or the pneumococcal phage CP1 lysozyme (CPL1) wherein the choline binding domain is modified to include a heterologous T-helper epitope. Such fusion partners are shown to improve the expression level of the heterologous protein attached thereto and also find particular utility when fused to poorly immunogenic proteins or peptides that are otherwise useful as vaccine antigens. More particularly, such fusion partners are useful in constructs comprising self-antigens, eg tumour specific or tissue specific antigens.

Background to the invention

[0002] *Streptococcus pneumoniae* synthesises an N acetyl-L-alanine amidase, LytA, an autolysin that specifically degrades the peptidoglycan backbone of the cell wall eventually leading to cell lysis. Its polypeptide chain has two domains. The N-terminal domain is responsible for the catalytic activity, whereas the C-terminal domain of LytA is responsible for the affinity to choline and anchorage to the cell wall. This C-terminal domain is known to bind to choline and choline analogues, and will also bind to tertiary amines such as DEAE (diethyl amino ethyl) commonly used in chromatography.

[0003] LytA is a 318 amino acid protein, and the C-terminal part comprises a tandem of six imperfect repeats of 20 or 21 amino acids and a short COOH-terminal tail. The repeats are located at the following positions:

R1: 177-191
R2: 192-212
R3: 213-234
R4: 235-254
R5: 255-275
R6: 276-298

[0004] These repeats are predicted to be in a beta-turn conformation. The C-terminus is responsible for binding choline. Likewise the C-terminus of CPL1 is responsible for binding affinity and the aromatic residues in the repeat contribute to such binding. These proteins have been used as affinity tags to allow for rapid purification (Sanchez Puellas, Eur J Biochem. 1992, 203, 153-9).

[0005] Other proteins with a choline-binding domain have also been studied in *Streptococcus pneumoniae*.

[0006] One of them PspA (or Pneumococcal Surface Protein A), is a virulence factor (Yother J and Briles (1992) J Bacteriol 174(2) p 601). This protein is antigenic and immunogenic. It has a C-terminal domain consisting of 10 repeats of 20 amino acids, homologous with repeats of LytA.

[0007] CbpA (or Choline-Binding Protein A) is involved in the adherence of the pneumococcus to human cells (Rosenow et al (1997) Mol Microbiol 25 (5) p 819). It shows 10 repeats of 20 amino acids in the C-terminal domain which are almost identical to those of PspA.

[0008] LytB and LytC have a different modular organisation from the above-mentioned proteins as their choline-binding domain, made up of 15 repeats and 11 repeats respectively, is situated at the N-terminal end, not at the C-terminal end (Garcia P Mol Microbiol (1999) 31 (4) p1275 and Garcia P et al (1999) Mol Microbiol 33(1) p128). Sequence comparison shows LytB to have glucosamidase activity. LytC shows in vitro a lysozyme-type activity. Additionally, three genes called PepA, PepB and PepC were cloned in 1995. Although their function is unknown, these genes also have a variable number of repeats homologous to those of LytA.

[0009] In their infection cycle, phages synthesise murein hydrolases facilitating their passage into the bacterium. These hydrolases have a choline-binding domain.

[0010] The mureinase CPL1 of the phage Cp-1 has been well studied. It shows 6 repeats of 20 amino acids at the C-terminus involved in the specific recognition of choline (Garica J. L. J. Virol 61 (8) p2573-80; (1987) and Garcia E Prol Natl Acad Sci (1988) p914). A comparison of the LytA and CPL1 repeats enables an initial consensus of those repeats to be made. [0010] The murein hydrolases of phages Dp-1 (Garcia P et al (1983) J Gen Microbiol 129 (2) p489, Cpl-9 (Garcia P et al (1989) Biochem Biophys Res Commun 158(1) p 251, HB-3 Romero et al 1990 J Bacteriol 172 (9) p 5064-5070) and E.J-1 Diaz (1992) J Bacteriol 174 (17) p 5516), also show the characteristics of choline-binding domains.

[0011] This property is also shared by the lysozyme encoded by CP-1 a pneumococcal phage. WO 99/10375 describes *inter alia*, human papilloma virus proteins E6, or E7 linked to a His tag and the C-terminal portion of LytA (herein (C-LytA) and the purification of the proteins by differential affinity chromatography.

WO 99/40188 describes *inter alia* fusion proteins comprising MAGE antigens with a His tails and a C-LyTA portion at the N-terminus of the molecule.

[0012] It has now been surprisingly found that fusion partners according to the present invention, when fused to a heterologous protein were capable of enhancing the immunogenicity of the heterologous proteins attached thereto. It has also been found that the expression level of the heterologous proteins attached thereto can be enhanced. The present invention accordingly provides in a preferred embodiment an improved immunological fusion partner which can also act as an expression enhancer.

Summary of the invention

[0013] Accordingly the present invention comprises a fusion partner molecule comprising a choline binding domain or a fragment thereof or an analogue thereof, and a heterologous promiscuous T helper epitope, preferably a promiscuous MHC Class II T-epitope. Said fusion partner shows a capability of acting as both an immunological fusion partner, or as an expression enhancer and preferably as both an immunological partner and expression enhancer. A promiscuous T-helper epitope is an epitope that binds to more than one MHC Class II allele, preferably more than 3 MHC Class II alleles. In particular such epitopes are capable of eliciting helper T cell response in large numbers of individuals expressing diverse MHC haplotypes. Optionally, the fusion protein may retain its capability to bind to choline.

[0014] In a preferred embodiment the choline binding moiety is derived from the C terminus of LyTA. Preferably the C-LyTA or derivatives comprises at least four repeats of any of the repeats R1 to R6 set forth in figure 1 (SEQ ID NO:1 to 6). In a most preferred embodiment, the C-LyTA extends from amino acid 177-298 which contains a portion of the first repeat and the complete five others.

[0015] In a further aspect of the invention, there is provided a fusion partner as herein defined further comprising a heterologous protein. The heterologous protein may be either chemically conjugated or fused to the fusion partner. Preferably the heterologous protein is a tumour-associated antigen or immunogenic fragment thereof.

[0016] In a further aspect of the invention there is provided a nucleic acid sequence encoding the proteins as herein defined. There is also provided an expression vector comprising said nucleic acid, and a host transformed with said nucleic acid or vector.

[0017] In a further aspect of the invention there is provided an immunogenic composition comprising a protein or a nucleic acid sequence as herein described, and a pharmaceutically acceptable excipient, diluent or carrier. Preferably the immunogenic composition further comprises a Th-1 inducing adjuvant.

[0018] In yet a further embodiment, the invention provides the immunogenic composition or protein and nucleic acids for use in medicine. In particular, there is provided a protein or a nucleic acid of the invention, in the manufacture of a medicament for eliciting an immune response in a patient, or for use in the treatment or prophylaxis of infectious diseases or cancer diseases.

[0019] The invention further provides for methods of treating a patient suffering from an infectious disease or a cancer disease, particularly carcinoma of the breast, lung (particularly non - small cell lung carcinoma), colorectal, ovarian, prostate, gastric and other GI (gastrointestinal) by the administration of a safe and effective amount of a composition or nucleic acid as herein described.

[0020] In yet a further embodiment the invention provides a method of producing an immunogenic composition as herein described by admixing a nucleic acid or protein of the invention with a pharmaceutically acceptable excipient, diluent or carrier.

Detailed description of the invention

[0021] As described therein, in one embodiment of the present invention the modified choline binding domain (fusion partner) has a capability of acting as an expression enhancer with the resulting fusion protein will be expressed at a higher yield in a host cell as compared to the unfused protein, preferably at a yield greater than about 100% (2-fold higher) or 150% or more, as measured by SDS-PAGE followed by Coomassie blue staining or silver staining, optionally followed by gel scanning. The modified choline binding domain according to the invention has also the capability of acting as an immunological partner with the resulting fusion protein with a heterologous protein will be more immunogenic in a host as compared to the unfused heterologous protein.

[0022] In another embodiment of the present invention, the modified choline binding domain has the capability to act as an immunological fusion partner, allowing an enhanced immune response to be obtained with the fusion protein as compared to the heterologous protein alone.

[0023] In a preferred embodiment, the modified choline binding domain has a dual function, having the capability to act as both an immunological fusion partner and as an expression enhancer.

[0024] In a preferred embodiment the choline binding moiety is derived from the C terminus of LyTA. Preferably the C-LyTA or derivatives comprises at least two repeats, preferably at least four repeats. In this context, C-LyTA derivatives

refer to a variant of C-LyTA according to the present invention, that is to say variants which have retained both the capability of acting as an immunological partner and an expression enhancer. Preferred variants include, for example, peptides comprising an amino acid sequence having at least 85% identity, preferably at least 90% identity, more preferably at least 95% identity, most preferably at least 97-99% identity, to any of the repeats R1 to R6 set forth in figure 1 (SEQ ID NO:1 to 6), or a peptide comprising an amino acid sequence having at least 15, 20, 30, 40, 50 or 100 contiguous amino acids from the amino acid sequence set forth in figure 1 (SEQ ID NO:1 to 8).

[0025] Accordingly, in one aspect of the invention there is provided a fusion partner protein comprising a modified choline binding domain and a heterologous promiscuous T helper epitope, wherein the choline binding domain is selected from the group comprising:

- a) the C-terminal domain of LyTA as set forth in SEQ ID NO:7;
- b) the sequence of SEQ ID NO:8;
- c) a peptide sequence comprising an amino acid sequence having at least 85% identity, preferably at least 90% identity, more preferably at least 95% identity, most preferably at least 97-99% identity, to any of SEQ ID NO:1 to 6;
- d) a peptide sequence comprising an amino acid sequence having at least 15, 20, 30, 40, 50 or 100 contiguous amino acids from the amino acid sequence of SEQ ID NO:7 or SEQ ID NO:8.

In a most preferred embodiment, the C-LyTA extends from amino acid 177-298 which contains a portion of the first repeat and the complete five others, as set forth in figure 1.

[0026] The second component of the fusion partner, the heterologous T-cell epitope is preferably selected from the group of epitopes that will bind to a number of individuals expressing more than one MHC II molecules in humans. For example, epitopes that are specifically contemplated are P2 and P30 epitopes from tetanus toxoid, Panina - Bordignon Eur. J. Immunol 19 (12), 2237 (1989). In a preferred embodiment the heterologous T-cell epitope is P2 or P30 from Tetanus toxin.

[0027] The P2 epitope has the sequence QYIKANSKFIDGE and corresponds to amino acids 830-843 of the Tetanus toxin. The P30 epitope (residues 947-967 of Tetanus Toxin) has the sequence FNNFTVSFWLRVPKVSASHLE. The FNNFTV sequence may optionally be deleted. Other universal T epitopes can be derived from the circumsporozoite protein from *Plasmodium falciparum* - in particular the region 378-398 having the sequence DIEKIAKMEKASSVFNVNS (Alexander J. (1994) *Immunity* 1 (9), p 751-761). Another epitope is derived from Measles virus fusion protein at residue 288-302 having the sequence LSEIKGVIVHRELG (Partidos CD, 1990, J. Gen. Virol 71(9) 2099-2105). Yet another epitope is derived from hepatitis B virus surface antigen, in particular amino acids, having the sequence FLL-TRILTIQSLD. Another set of epitopes is derived from diphtheria toxin. Four of these peptides (amino acids 271-290, 321-340, 331-350, 351-370) map within the T domain of fragment B of the toxin, and the remaining 2 map in the R domain (411-430, 431-450):

```

25: 3207-14.)
```

[0028] The heterologous T-epitope is preferably fused to C-LyTA containing at least 4 repeats, preferably repeat 2-5 inclusive. One or more subsequent repeats may optionally be fused to the C-terminus of the T-epitope. Alternatively, the heterologous T-epitope is preferably inserted between two consecutive repeats of C-LyTA containing a total of at least 4 repeats, or inserted into one of the repeats of C-LyTA containing a total of at least 4 repeats. More preferably, the C-LyTA contains 6 repeats and the heterologous epitope is inserted within and at the beginning of the sixth repeat of C-LyTA.

[0029] The present invention further provides, in other aspects, fusion proteins that comprise at least one polypeptide as described above, as well as polynucleotides encoding such fusion proteins, typically in the form of pharmaceutical compositions, e.g., vaccine compositions, comprising a physiologically acceptable carrier and/or an immunostimulant. Thus a self-protein or other poorly immunogenic protein may be fused to either the N or C terminal end of the resulting fusion partner. Alternatively the self protein or poorly immunogenic protein may be inserted into the fusion partner. In an optional embodiment a histidine tag or at least four, preferably more than 6 histidine residues, may be fused to the alternative end of the poorly immunogenic protein. This would allow for the protein to be purified by affinity chromatography steps, as a histidine tail, typically comprising at least four, preferably six or more residues binds to metal ions and

therefore is suitable for metal immobilised metal ion affinity chromatography (IMAC).
Typical constructs would therefore comprise:

- Poorly-immunogenic protein - C-LyIA repeats_{1,4}-P₂ epitope (inserted in or replacing C-LyIA repeats₅)-C-LyIA repeats
- 5 - C-LyIA repeats_{1,4}-P₂ epitope (inserted in or replacing C-LyIA repeats₆)-C-LyIA repeats₆-Poorly immunogenic protein
- Poorly immunogenic protein - C-LyIA repeats_{2,5}-P₂ epitope (inserted into C-LyIA repeats₆)
- C-LyIA_{2,5}-P₂ epitope (inserted into C-LyIA repeats₆)- Poorly immunogenic protein.
- Poorly immunogenic protein C-LyIA repeats_{1,5}-P₂ epitope- inserted in C-LyIA repeats₆
- C-LyIA repeats_{1,5}-P₂ epitope- inserted in C-LyIA repeats₆- Poorly immunogenic protein
- 10 - Poorly immunogenic protein- P₂ epitope inserted into C-LyIA repeat₁-C-LyIA repeats_{2,5}
- P₂ epitope inserted into C-LyIA repeat₁-C-LyIA repeats_{2,5}- Poorly immunogenic protein
- Poorly immunogenic protein- P₂ epitope inserted into C-LyIA repeat₁-C-LyIA repeats_{2,6}
- P₂ epitope inserted into C-LyIA repeat₁-C-LyIA repeats_{2,6}- Poorly immunogenic protein
- Poorly immunogenic protein-C-LyIA repeat₁-P₂ epitope inserted into C-LyIA repeat₂-C-LyIA repeats_{3,6}
- 15 - C-LyIA repeat₁-P₂ epitope inserted into C-LyIA repeat₂-C-LyIA repeats_{3,6}- Poorly immunogenic protein;

where "inserted into" means at any place into the repeat for example between residue 1 and 2, or between 2 and 3, etc.

- [0030] The promiscuous T helper epitope may be inserted within a repeat region for example C-LyIA repeats_{2,5} - C-LyIA repeat 6a-P₂ epitope - C-LyIA repeat 6b, where the P₂ epitope is inserted within the sixth repeat (see figure 2).
- 20 [0031] In other preferred embodiments the C-terminal end of CPL1 (C-CPL1) may be used as an alternative to C-LyIA.
- [0032] Alternatively, the P₂ epitope in the above constructs may be replaced by other promiscuous T epitopes, for example P30. In an embodiment of the invention, two or more promiscuous epitopes are part of the fusion construct. It is however preferred to keep the fusion partner as small as possible, thus limiting the number of potentially interfering CD8+ and B epitopes. Thus the fusion partner is preferably no bigger than 100-140 amino acids, preferably no bigger
- 25 than 120 amino acids, typically about 100 amino acid.
- [0033] The antigen to which the fusion partner is fused may be from bacterial, viral, protozoan, fungal or mammalian, including human, sources.

- [0034] The fusion partner of the present invention are preferably fused to a self antigen such as a tumour associated or tissue specific antigens such as those for prostate, breast, colorectal, lung, pancreatic, ovarian, renal or melanoma cancers. Fragments of said self or tumour antigens are expressly contemplated to be fused to the fusion partner of the invention. Typically the fragment will contain at least 20, preferably 50, more preferably 100 contiguous amino acids of the full-length sequence. Typically such fragments will be devoid of one or more transmembrane domains or may have N-terminal or C-terminal deletions of about 3, 5, 8, 10, 15, 20, 28, 33, 50, 54 amino acids. Such fragments will, when suitably presented, be able to generate immune responses that recognise the full length protein. Particularly illustrative
- 30 polypeptides of the present invention comprise a sequence of at least 10 contiguous amino acids, preferably 20, more preferably 30, 40, 50, 60, 70, 80, 90, 100, 110, 120, 130, 140, 150, 160, 170, 180 amino acids of a tumour associated or tissue specific protein fused to the fusion partner.

- [0035] The polypeptides of the invention are immunogenic, i.e., they react detectably within an immunoassay (such as an ELISA or T-cell stimulation assay) with antisera and/or T-cells from a patient with crypto expressing cancer.
- 40 Screening for immunogenic activity can be performed using techniques well known to the skilled artisan. For example, such screens can be performed using methods such as those described in Harlow and Lane, *Antibodies: A Laboratory Manual*, Cold Spring Harbor Laboratory, 1988. In one illustrative example, a polypeptide may be immobilised on a solid support and contacted with patient sera to allow binding of antibodies within the sera to the immobilised polypeptide. Unbound sera may then be removed and bound antibodies detected using, for example, ¹²⁵I-labeled Protein A. As would
- 45 be recognised by the skilled artisan, immunogenic portions of tumour associated or tumour specific antigen are also encompassed by the present invention. An "immunogenic portion" as used herein, is a fragment that itself is immunologically reactive (i.e., specifically binds) with the B-cells and/or T-cell surface antigen receptors that recognize the polypeptide. Immunogenic portions may generally be identified using well known techniques, such as those summarized in Paul, *Fundamental Immunology*, 3rd ed., 243-247 (Raven Press, 1993) and references cited therein. Such techniques
- 50 include screening polypeptides for the ability to react with antigen-specific antibodies, antisera and/or T-cell lines or clones. As used herein, antisera and antibodies are "antigen-specific" if they specifically bind to an antigen (i.e., they react with the protein in an ELISA or other immunoassay, and do not react detectably with unrelated proteins). Such antisera and antibodies may be prepared as described herein, and using well-known techniques. In one preferred embodiment, an immunogenic portion of a polypeptide is a portion that reacts with antisera and/or T-cells at a level that
- 55 is not substantially less than the reactivity of the full-length polypeptide (e.g., in an ELISA and/or T-cell reactivity assay). Preferably, the level of immunogenic activity of the immunogenic portion is at least about 50%, preferably at least about 70% and most preferably greater than about 90% of the immunogenicity for the full-length polypeptide. In some instances, preferred immunogenic portions will be identified that have a level of immunogenic activity greater than that of the

corresponding full-length polypeptide, e.g., having greater than about 100% or 150% or more immunogenic activity.

[0036] In certain other embodiments, illustrative immunogenic portions may include peptides in which an N-terminal leader sequence and/or transmembrane domain have been deleted. Other illustrative immunogenic portions will contain a small N- and/or C-terminal deletion (e.g., about 1-50 amino acids, preferably about 1-30 amino acids, more preferably about 5-15 amino acids), relative to the mature protein.

[0037] Exemplary antigens or fragments derived therefrom include MAGE 1, MAGE 3 and MAGE 4 or other MAGE antigens such as disclosed in WO 99/40188, PRAME (WO 96/10577), BAGE, RAGE, LAGE 1 (WO 98/32855), LAGE 2 (also known as NY-ESO-1, WO 98/14464), XAGE (Liu et al., Cancer Res, 2000, 60:4752-4755; WO 02/18584) SAGE, and HAGE (WO 99/53061) or GAGE (Robbins and Kawakami, 1996, Current Opinions in Immunology 8, pps 628-636; Van den Eynde et al., International Journal of Clinical & Laboratory Research (submitted 1997); Correale et al. (1997). Journal of the National Cancer Institute 89, p293. Indeed these antigens are expressed in a wide range of tumour types such as melanoma, lung carcinoma, sarcoma and bladder carcinoma.

[0038] In a preferred embodiment prostate antigens are utilised, such as Prostate specific antigen (PSA), PAP, PSMA (PNAS 95(4) 1735 -1740 1998), PSMA or the antigen known as prostate.

[0039] In a particularly preferred embodiment, the prostate antigen is P501S or a fragment thereof. P501S, also named protein (Xu et al., Cancer Res. 61, 2001, 1563-1568), is known as SEQ ID NO. 113 of WO98/37814 and is a 553 amino acid protein. Immunogenic fragments and portions thereof comprising at least 20, preferably 50, more preferably 100 contiguous amino acids as disclosed in the above referenced patent application and are specifically contemplated by the present invention. Preferred fragments are disclosed in WO 98/50567 (PS108 antigen) and as prostate cancer-associated protein (SEQ ID NO: 9 of WO 99/67384). Other preferred fragments are amino acids 51-553, 34-553 or 55-553 of the full-length P501S protein. In particular, construct 1, 2 and 3 (see figure 2, SEQ ID NOs. 27-32) are expressly contemplated, and can be expressed in yeast systems, for example DNA sequences encoding such polypeptides can be expressed in yeast system.

[0040] Prostate is a prostate-specific serine protease (trypsin-like), 254 amino acid-long, with a conserved serine protease catalytic triad H-D-S and a amino-terminal pre-propeptide sequence, indicating a potential secretory function (P. Nelson, Lu Gan, C. Ferguson, P. Moss, R. linas, L. Hood & K. Wand, "Molecular cloning and characterisation of prostate, an androgen-regulated serine protease with prostate restricted expression, In Proc. Natl. Acad. Sci. USA (1999) 96, 3114-3119). A putative glycosylation site has been described. The predicted structure is very similar to other known serine proteases, showing that the mature polypeptide folds into a single domain. The mature protein is 224 amino acids-long, with one A2 epitope shown to be naturally processed. Prostate nucleotide sequence and deduced polypeptide sequence and homologues are disclosed in Ferguson, et al. (Proc. Natl. Acad. Sci. USA 1999, 96, 3114-3119) and in International Patent Applications No. WO 98/12302 (and also the corresponding granted patent US 5,955,306), WO 98/20117 (and also the corresponding granted patents US 5,840,871 and US 5,786,148) (prostate-specific kallikrein) and WO 00/04149 (P703P).

[0041] Other prostate specific antigens are known from WO98/37418, and WO/004149. Another is STEAP (PNAS 96 14523 14528 7 -12 1999).

[0042] Other tumour associated antigens useful in the context of the present invention include: Plu -1 J Biol. Chem 274 (22) 15633-15645, 1999, HASH-1, HASH-2 (Alders, M. et al., Hum. Mol. Genet. 1997, 6, 859-867), Cripto (Salomon et al Bioessays 199, 21 61 -70, US patent 5654140), CASB616 (WO 00/53216), Criptin (US 5,981,215). Additionally, antigens particularly relevant for vaccines in the therapy of cancer also comprise tyrosinase, telomerase, P53, NY-Brl.1 (WO 01/47959) and fragments thereof such as disclosed in WO 00/43420, B726 (WO 00/60076, SEQ ID nos 469 and 463; WO 01/79286, SEQ ID nos 474 and 475), P510 (WO 01/34802 SEQ ID nos 537 and 538) and survivin.

[0043] The present invention is also useful in combination with breast cancer antigens such as Her-2/neu, mammaprotein (US patent 5,668,267), B3505 (WO 00/61753 SEQ ID nos 299, 304, 305 and 315), or those disclosed in WO 00/52165, WO 99/33869, WO 99/19479, WO 98/45328. Her-2/neu antigens are disclosed inter alia, in US patent 5,801,005. Preferably the Her-2/neu comprises the entire extracellular domain (comprising approximately amino acid 1-645) or fragments thereof and at least an immunogenic portion of or the entire intracellular domain approximately the C terminal 580 amino acids. In particular, the intracellular portion should comprise the phosphorylation domain or fragments thereof. Such constructs are disclosed in WO 00/44899. A particularly preferred construct is known as ECD-PhD, a second is known as ECD deltaPhD (see WO 00/44899). The Her-2/neu as used herein can be derived from rat, mouse or human.

[0044] Certain tumour antigens are small peptide antigens (ie less than about 50 amino acids). These antigens can be chemically conjugated to the modified choline binding protein of the present invention.

[0045] Exemplary peptides include Mucin derived peptides such as MUC-1 (see for example US 5,744,144; US 5,827,666; WO 88/05054, US 4,963,484). Specifically contemplated are MUC-1 derived peptides that comprise at least one repeat unit of the MUC-1 peptide, preferably at least two such repeats and which is recognised by the SM3 antibody (US 6,054,438). Other mucin derived peptides include peptide from MUC-5.

[0046] Alternatively, said antigen is an interleukin such as IL13 and IL14, which are preferred. Or said antigen maybe

a self peptide hormone such as whole length Gonadotrophin hormone releasing hormone (GnRH, WO 95/20600), a short 10 amino acid long peptide, useful in the treatment of many cancers, or in immunocastration.

[0047] Other tumour-specific antigens are suitable to be coupled with the modified Choline binding protein of the present invention include, but are not restricted to tumour-specific gangliosides such as GM2, and GM3.

[0048] The covalent coupling of the peptide to modified choline binding protein can be carried out in a manner well known in the art. Thus, for example, for direct covalent coupling it is possible to utilise a carbodimide, glutaraldehyde or (N- ϵ -maleimidobutyryloxy) succinimide ester, utilising common commercially available heterobifunctional linkers such as CDAP and SPDP (using manufacturers instructions). After the coupling reaction, the immunogen can easily be isolated and purified by means of a dialysis method, a gel filtration method, a fractionation method etc.

[0049] The antigen may also be derived from sources which are pathogenic to humans, such as such as Human Immunodeficiency virus HIV-1 (such as tat, nef, reverse transcriptase, gag, gp120 and gp160), human herpes simplex viruses, such as gD or derivatives thereof or Immediate Early protein such as ICP27 from HSV1 or HSV2, cytomegalovirus ((esp Human)(such as gB or derivatives thereof), Rotavirus (including live-attenuated viruses), Epstein Barr virus (such as gp350 or derivatives thereof), Varicella Zoster Virus (such as gpl, II and IE63), or from a hepatitis virus such as hepatitis B virus (for example Hepatitis B Surface antigen or a derivative thereof), hepatitis A virus, hepatitis C virus and hepatitis E virus, or from other viral pathogens, such as paramyxoviruses: Respiratory Syncytial virus (such as F and G proteins or derivatives thereof), parainfluenza virus, measles virus, mumps virus, human papilloma viruses (for example HPV6, 11, 16, 18, ...), flaviviruses (e.g. Yellow Fever Virus, Dengue Virus, Tick-borne encephalitis virus, Japanese Encephalitis Virus) or Influenza virus (whole live or inactivated virus, split influenza virus, grown in eggs or MDCK cells, or whole flu viroosomes (as described by R. Gluck, Vaccine, 1992, 10, 915-920) or purified or recombinant proteins thereof, such as HA, NP, NA, or M proteins, or combinations thereof), or derived from bacterial pathogens such as

Neisseria spp, including *N. gonorrhoea* and *N. meningitidis* (for example capsular polysaccharides and conjugates thereof, transferrin-binding proteins, lactoferrin binding proteins, PilC, adhesins); *S. pyogenes* (for example M proteins or fragments thereof, CSA protease, lipoteichoic acids), *S. agalactiae*, *S. mutans*; *H. ducreyi*; *Moraxella* spp, including *M. catarrhalis*, also known as *Branhamella catarrhalis* (for example high and low molecular weight adhesins and invasins);

Bordetella spp, including *B. pertussis* (for example pertactin, pertussis toxin or derivatives thereof, filamentous hemagglutinin, adenylate cyclase, fimbriae), *B. parapertussis* and *B. bronchiseptica*; *Mycobacterium* spp., including *M. tuberculosis* (for example ESAT6, Antigen 85A, -B or -C), *M. bovis*, *M. leprae*, *M. avium*, *M. paratuberculosis*, *M. smegmatis*; *Legionella* spp, including *L. pneumophila*; *Escherichia* spp, including enterotoxigenic *E. coli* (for example colonization factors, heat-labile toxin or derivatives thereof, heat-stable toxin or derivatives thereof, enterohemorrhagic *E. coli*, enteropathogenic *E. coli* (for example shiga toxin-like toxin or derivatives thereof); *Vibrio* spp, including *V. cholera* (for example cholera toxin or derivatives thereof); *Shigella* spp, including *S. sonnei*, *S. dysenteriae*, *S. flexneri*; *Yersinia* spp, including *Y. enterocolitica* (for example a Yop protein), *Y. pestis*, *Y. pseudotuberculosis*; *Campylobacter* spp, including *C. jejuni* (for example toxins, adhesins and invasins) and *C. coli*, *Salmonella* spp, including *S. typhi*, *S. paratyphi*, *S. choleraesuis*, *S. enteritidis*; *Listeria* spp., including *L. monocytogenes*; *Helicobacter* spp, including *H. pylori* (for example urease, catalase, vacuolating toxin); *Pseudomonas* spp, including *P. aeruginosa*; *Staphylococcus* spp., including *S. aureus*, *S. epidermidis*; *Enterococcus* spp., including *E. faecalis*, *E. faecium*; *Clostridium* spp, including *C. tetani* (for example tetanus toxin and derivative thereof), *C. botulinum* (for example botulinum toxin and derivative thereof), *C. difficile* (for example clostridium toxins A or B and derivatives thereof); *Bacillus* spp, including *B. anthracis* (for example botulinum toxin and derivatives thereof); *Corynebacterium* spp., including *C. diphtheriae* (for example diphtheria toxin and derivatives thereof); *Borrelia* spp., including *B. burgdorferi* (for example OspA, OspC, DbpA, DbpB), *B. garinii* (for example OspA, OspC, DbpA, DbpB), *B. afzelii* (for example OspA, OspC, DbpA, DbpB), *B. andersonii* (for example OspA, OspC, DbpA, DbpB), *B. hermsii*; *Ehrlichia* spp., including *E. equi* and the agent of the Human Granulocytic Ehrlichiosis; *Rickettsia* spp, including *R. rickettsii*; *Chlamydia* spp., including *C. trachomatis* (for example MOMP, heparin-binding proteins), *C. pneumoniae* (for example MOMP, heparin-binding proteins), *C. psittaci*; *Leptospira* spp., including *L. interrogans*; *Treponema* spp., including *T. pallidum* (for example the rare outer membrane proteins), *T. denticola*, *T. hyodysenteriae*, or derived from parasites such as *Plasmodium* spp., including *P. falciparum*, *Toxoplasma* spp., including *T. gondii* (for example SAG2, SAG3, Tg34); *Entamoeba* spp., including *E. histolytica*; *Babesia* spp., including *B. microti*; *Trypanosoma* spp., including *T. cruzi*; *Giardia* spp., including *G. lamblia*; *Leshmania* spp., including *L. major*; *Pneumocystis* spp., including *P. carinii*; *Trichomonas* spp., including *T. vaginalis*; *Schistosoma* spp., including *S. mansoni*, or derived from yeast such as *Candida* spp., including *C. albicans*; *Cryptococcus* spp., including *C. neoformans*.

[0050] Other preferred specific antigens for *M. tuberculosis* are for example Tb Ra12, Tb H9, Tb Ra35, Tb38-1, Erd 14, DPV, MTI, MSL, mTTC2 and hTCC1 (WO 99/51748). Proteins for *M. tuberculosis* also include fusion proteins and variants thereof where at least two, preferably three polypeptides of *M. tuberculosis* are fused into a larger protein.

Preferred fusions include Ra12-TbH9-Ra35, Erd14-DPV-MTI, DPV-MTI-MSL, Erd14-DPV-MTI-MSL-mTTC2, Erd14-DPV-MTI-MSL, DPV-MTI-MSL-mTTC2, TbH9-DPV-MTI (WO 99/51748).

[0051] Most preferred antigens for Chlamydia include for example the High Molecular Weight Protein (HWWP) (WO 99/17741), ORF3 (EP 366 412), and putative membrane proteins (Pmps). Other Chlamydia antigens of the vaccine

formulation can be selected from the group described in WO 99/28475.

[0052] Preferred bacterial antigens are derived from *Streptococcus spp.*, including *S. pneumoniae* (for example capsular polysaccharides and conjugates thereof, PsaA, PspA, streptolysin, choline-binding proteins) and the protein antigen Pneumolysin (Biochem Biophys Acta, 1989, 67, 1007; Rubins et al., Microbial Pathogenesis, 25, 337-342), and mutant detoxified derivatives thereof (WO 90/06951; WO 99/03884). Other preferred bacterial antigens are derived from *Haemophilus spp.*, including *H. influenzae* type B (for example PRP and conjugates thereof), non typeable *H. influenzae*, for example OMP26, high molecular weight adhesins, P5, P6, protein D and lipoprotein D, and fimbria and fimbria derived peptides (US 5,843,464) or multiple copy variants or fusion proteins thereof.

[0053] Derivatives of Hepatitis B Surface antigen are well known in the art and include, inter alia, those PreS1, PreS2 S antigens set forth described in European Patent applications EP-A-414 374; EP-A-0304 578, and EP 198-474. In one preferred The HBV antigen is HBV polymerase (Ji Hoon Jeong et al, 1996, BBRG 223, 264-271; Lee H.J. et al., Biotechnol. Lett. 15, 821-826). In another preferred aspect the antigen within the fusion is a HIV-1 antigen, gp120, especially when expressed in CHO cells. In a further embodiment, antigen comprises gD2t as hereinabove defined.

[0054] In a preferred embodiment of the present invention fusions comprise an antigen derived from the Human Papilloma Virus (HPV 6a, 6b, 11, 16, 18, 31, 33, 35, 39, 45, 51, 52, 56, 58, 59 and 68), in particular those HPV serotypes considered to be responsible for genital warts (HPV 6 or HPV 11 and others), and the HPV viruses responsible for cervical cancer (HPV16, HPV18 and others).

[0055] Suitable HPV antigens are E1, E2, E4, E5, E6, E7, L1 and L2. Particularly preferred forms of genital wart prophylactic, or therapeutic, fusions comprise L1 particles or capsomers, and fusion proteins comprising one or more antigens selected from the HPV 6 and HPV 11 proteins E6, E7, L1, and L2.

[0056] The most preferred forms of fusion protein are: L2E7 as disclosed in WO 96/26277, and proteinD(1/3)-E7 disclosed in GB 9717953.5 (PCT/EP98/05285).

[0057] A preferred HPV cervical infection or cancer, prophylaxis or therapeutic vaccine, composition may comprise HPV 16 or 18 antigens. For example, L1 or L2 antigen monomers, or L1 or L2 antigens presented together as a virus like particle (VLP) or the L1 alone protein presented alone in a VLP or capsomer structure. Such antigens, virus like particles and capsomer are per se known. See for example WO94/00152, WO94/20137, WO94/05792, and WO93/02184.

[0058] Additional early proteins may be included alone or as fusion proteins such as E7, E2 or preferably E5 for example; particularly preferred embodiments of this includes a VLP comprising L1 E7 fusion proteins (WO 96/11272). Particularly preferred HPV 16 antigens comprise the early proteins E6 or E7 in fusion with a protein D carrier to form Protein D - E6 or E7 fusions from HPV 16, or combinations thereof; or combinations of E6 or E7 with L2 (WO 96/26277). Alternatively the HPV 16 or 18 early proteins E6 and E7, may be presented in a single molecule, preferably a Protein D- E6/E7 fusion. Other fusions optionally contain either or both E6 and E7 proteins from HPV 18, preferably in the form of a Protein D - E6 or Protein D - E7 fusion protein or Protein D E6/E7 fusion protein. Fusions may comprise antigens from other HPV strains, preferably from strains HPV 31 or 33.

[0059] Fusions according to the present invention comprise antigens derived from parasites that cause Malaria. For example, preferred antigens from *Plasmodia falciparum* include RTS,S and TRAP. RTS is a hybrid protein comprising substantially all the C-terminal portion of the circumsporozoite (CS) protein of *P. falciparum* linked via four amino acids of the preS2 portion of Hepatitis B surface antigen to the surface (S) antigen of hepatitis B virus. Its full structure is disclosed in the International Patent Application No. PCT/EP92/02591, published under Number WO 93/10152 claiming priority from UK patent application No. 9124390.7. When expressed in yeast RTS is produced as a lipoprotein particle, and when it is co-expressed with the S antigen from HBV it produces a mixed particle known as RTS,S. TRAP antigens are described in the International Patent Application No. PCT/GB89/00895, published under WO 90/01496. A preferred embodiment of the present invention is a fusion wherein the antigenic preparation comprises a combination of the RTS, S and TRAP antigens. Other plasmodia antigens that are likely candidates to be components of the fusion are *P. falciparum* MSP1, AMA1, MSP3, EBA, GLURP, RAP1, RAP2, Sequestrin, PfEMP1, Pf332, LSA1, LSA3, STARP, SALSA, PEXEP1, Pfs25, Pfs28, PFS27/25, Pfs16, Pfs48/45, Pfs230 and their analogues in *Plasmodium spp.*

[0060] The present invention also provides a polynucleotide encoding the fusion partner according to the present invention. The invention further relates a polynucleotide that hybridise to the polynucleotide sequence provided herein in figure 1 (SEQ ID NO:9 to 16). In this regard, the invention especially relates to polynucleotides that hybridise under stringent conditions to the polynucleotide described herein. As herein used, the terms "stringent conditions" and "stringent hybridisation conditions" mean hybridisation occurring only if there is at least 95% and preferably at least 97% identity between the sequences. A specific example of stringent hybridization conditions is overnight incubation at 42°C in a solution comprising: 50% formamide, 5x SSC (150mM NaCl, 15mM trisodium citrate), 50 mM sodium phosphate (pH7.6), 5x Denhardt's solution, 10% dextran sulfate, and 20 micrograms/ml of denatured, sheared salmon sperm DNA, followed by washing the hybridisation support in 0.1x SSC at about 65°C. Hybridisation and wash conditions are well known and exemplified in Sambrook, et al., Molecular Cloning: A Laboratory Manual, Second Edition, Cold Spring Harbor, N.Y., (1989), particularly Chapter 11 therein. Solution hybridisation may also be used with the polynucleotide sequences provided by the invention.

[0061] The present invention also provides a polynucleotide encoding the polypeptide comprising the fusion partner according to the present invention fused to a tumour associated antigen or fragment thereof. In particular, the present invention provides for polynucleotide sequences encoding a fusion partner protein comprising a choline binding domain and a heterologous promiscuous T helper epitope, preferably wherein the choline binding domain is derived from the C terminus of LytA. In a more preferred embodiment, the C-LytA moiety of the polynucleotides according to the invention comprise at least four repeats of any of SEQ ID NO 9-14, more preferably comprise the sequence of SEQ ID NO 15, still more preferably the sequence of SEQ ID NO 16. In other related embodiments, the present invention provides for polynucleotide variants having substantial identity to the sequences disclosed herein in SEQ ID NOs 9-16, for example those comprising at least 70% sequence identity, preferably at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% or higher, sequence identity compared to a polynucleotide sequence of this invention using conventional methods, e.g., BLAST analysis using standard parameters. In a still further embodiment the polynucleotide as claimed further comprises a heterologous protein.

[0062] Such polynucleotide sequences can be inserted into a suitable expression vector and expressed in a suitable host. Vectors may be provided which encode the modified choline binding protein of the invention and which contain a suitable restriction site into which a DNA encoding a poorly immunogenic protein can be inserted to produce a fusion protein.

In other embodiments of the invention, polynucleotide sequences or fragments thereof which encode polypeptide fusions of the invention, may be used in recombinant DNA molecules to direct expression of a polypeptide in appropriate host cells. Due to the inherent degeneracy of the genetic code, other DNA sequences that encode substantially the same or a functionally equivalent amino acid sequence may be produced and these sequences may be used to clone and express a given polypeptide.

[0063] As will be understood by those of skill in the art, it may be advantageous in some instances to produce polypeptide-encoding nucleotide sequences possessing non-naturally occurring codons. The DNA code has 4 letters (A, T, C and G) and uses these to spell three letter "codons" which represent the amino acids the proteins encodes in an organism's genes. The linear sequence of codons along the DNA molecule is translated into the linear sequence of amino acids in the protein(s) encoded by those genes. The code is highly degenerate, with 61 codons coding for the 20 natural amino acids and 3 codons representing "stop" signals. Thus, most amino acids are coded for by more than one codon - in fact several are coded for by four or more different codons.

[0064] Where more than one codon is available to code for a given amino acid, it has been observed that the codon usage patterns of organisms are highly non-random. Different species show a different bias in their codon selection and, furthermore, utilisation of codons may be markedly different in a single species between genes which are expressed at high and low levels. This bias is different in viruses, plants, bacteria and mammalian cells, and some species show a stronger bias away from a random codon selection than others. For example, humans and other mammals are less strongly biased than certain bacteria or viruses. For these reasons, there is a significant probability that a mammalian gene expressed in *E. coli* or a viral gene expressed in mammalian cells will have an inappropriate distribution of codons for efficient expression. It is believed that the presence in a heterologous DNA sequence of clusters of codons which are rarely observed in the host in which expression is to occur, is predictive of low heterologous expression levels in that host.

[0065] In consequence, codons preferred by a particular prokaryotic (for example *E. coli* or yeast) or eukaryotic host can be optimised, that is selected to increase the rate of protein expression, to produce a recombinant RNA transcript having desirable properties, such as for example a half-life which is longer than that of a transcript generated from the naturally occurring sequence, or to optimise the immune response in humans. The process of codon optimisation may include any sequence, generated either manually or by computer software, where some or all of the codons of the native sequence are modified. Several methods have been published (Nakamura et al., Nucleic Acids Research 1996, 24: 214-215; WO98/34640). One preferred method according to this invention is SynGene method, a modification of Calgene method (R. S. Hale and G Thompson (Protein Expression and Purification Vol. 12 pp.185-188 (1998)).

[0066] Accordingly in a preferred embodiment the DNA sequence of the protein has a RSCU (Relative synonymous Codon usage (also known as Codon Index CI)) of at least 0.65 and have less than 85% identity to the corresponding wild type region.

[0067] This process of codon optimisation and the resulting constructs are advantageous as they may have some or all of the following benefits: 1) to improve expression of the gene product by replacing rare or infrequently used codons with more frequently used codons, 2) to remove or include restriction enzyme sites to facilitate downstream cloning and 3) to reduce the potential for homologous recombination between the insert sequence in the DNA vector and genomic sequences and 4) to improve the immune response in humans by raising a cellular and/or an antibody response (preferably both responses) against the target antigen. The sequences of the present invention advantageously have reduced recombination potential, but express to at least the same level as the wild type sequences. Due to the nature of the algorithms used by the SynGene programme to generate a codon optimised sequence, it is possible to generate an extremely large number of different codon optimised sequences which will perform a similar function. In brief, the codons

are assigned using a statistical method to give synthetic gene having a codon frequency closer to that found naturally in highly expressed E. coli and human genes. In brief, the codons are assigned using a statistical method to give synthetic gene having a codon frequency closer to that found naturally in highly expressed human genes such as β -Actin. Illustrative, although not limiting, examples of suitable codon-optimised sequences are given in SEQ ID NOs:19-22 and SEQ ID NOs:24-26.

[0068] In the polynucleotides of the present invention, the codon usage pattern is altered from that typical of the target antigen to more closely represent the codon bias of a highly expressed gene in a target organism, for example human β -actin. The "codon usage coefficient" is a measure of how closely the codon pattern of a given polynucleotide sequence resembles that of a target species. Codon frequencies can be derived from literature sources for the highly expressed genes of many species (see e.g. Nakamura et al. Nucleic Acids Research 1996, 24:214-215). The codon frequencies for each of the 61 codons (expressed as the number of occurrences occurrence per 1000 codons of the selected class of genes) are normalised for each of the twenty natural amino acids, so that the value for the most frequently used codon for each amino acid is set to 1 and the frequencies for the less common codons are scaled to lie between zero and 1. Thus each of the 61 codons is assigned a value of 1 or lower for the highly expressed genes of the target species. In order to calculate a codon usage coefficient for a specific polynucleotide, relative to the highly expressed genes of that species, the scaled value for each codon of the specific polynucleotide are noted and the geometric mean of all these values is taken (by dividing the sum of the natural logs of these values by the total number of codons and take the anti-log). The coefficient will have a value between zero and 1 and the higher the coefficient the more codons in the polynucleotide are frequently used codons. If a polynucleotide sequence has a codon usage coefficient of 1, all of the codons are "most frequent" codons for highly expressed genes of the target species.

[0069] According to the present invention, the codon usage pattern of the polynucleotide will preferably exclude codons representing < 10% of the codons used for a particular amino acid. A relative synonymous codon usage (RSCU) value is the observed number of codons divided by the number expected if all codons for that amino acid were used equally frequently. A polynucleotide of the present invention will preferably exclude codons with an RSCU value of less than 0.2 in highly expressed genes of the target organism. A polynucleotide of the present invention will generally have a codon usage coefficient for highly expressed human genes of greater than 0.6, preferably greater than 0.65, most preferably greater than 0.7. Codon usage tables for human can also be found in Genbank.

[0070] In comparison, a highly expressed beta actin gene has a RSCU of 0.747.

[0071] The codon usage table (Table 1) for a homo sapiens is set out below:

Table 1. Codon usage for human (highly expressed) genes 1/24/91 (human_high.cod)

[0072] A DNA sequence encoding the fusion proteins or modified choline binding protein of the present invention can be synthesised using standard DNA synthesis techniques, such as by enzymatic ligation as described by D.M. Roberts *et al.* in *Biochemistry* 1985, 24, 5090-5098, by chemical synthesis, by *in vitro* enzymatic polymerisation, or by PCR technology utilising for example a heat stable polymerase, or by a combination of these techniques

[0073] Enzymatic polymerisation of DNA may be carried out *in vitro* using a DNA polymerase such as DNA polymerase I (Klenow fragment) or Taq polymerase in an appropriate buffer containing the nucleoside triphosphates dATP, dCTP, dGTP and dTTP as required at a temperature of 10°-37°C, generally in a volume of 50µl or less. Enzymatic ligation of DNA fragments may be carried out using a DNA ligase such as T4 DNA ligase in an appropriate buffer, such as 0.05M Tris (pH 7.4), 0.01 M MgCl₂, 0.01 M dithiothreitol, 1mM spermidine, 1mM ATP and 0.1 mg/ml bovine serum albumin, at a temperature of 4°C to ambient, generally in a volume of 50 µl or less. The chemical synthesis of the DNA polymer or fragments may be carried out by conventional phosphotriester, phosphate or phosphoramidite chemistry, using solid phase techniques such as those described in 'Chemical and Enzymatic Synthesis of Gene Fragments - A Laboratory Manual' (ed. H.G. Gassen and A. Lang), Verlag Chemie, Weinheim (1982), or in other scientific publications, for example M.J. Gait, H.W.D. Matthes, M. Singh, B.S. Sproat, and R.C. Titmas, *Nucleic Acids Research*, 1982, 10, 6243; B.S. Sproat, and W. Bannwarth, *Tetrahedron Letters*, 1983, 24, 5771; M.D. Matteucci and M.H. Caruthers, *Tetrahedron Letters*, 1980, 21, 719; M.D. Matteucci and M.H. Caruthers, *Journal of the American Chemical Society*, 1981, 103, 3185; S.P. Adams *et al.*, *Journal of the American Chemical Society*, 1983, 105, 661; N.D. Sinha, J. Biernat, J. McManus, and H. Koester, *Nucleic Acids Research*, 1984, 12, 4539; and H.W.D. Matthes *et al.*, *EMBO Journal*, 1984, 3, 801.

[0074] The process of the invention may be performed by conventional recombinant techniques such as described in Maniatis *et al.*, *Molecular Cloning - A Laboratory Manual*; Cold Spring Harbor, 1982-1989.

[0075] In particular, the process may comprise the steps of:

- i) preparing a replicable or integrating expression vector capable, in a host cell, of expressing a DNA polymer comprising a nucleotide sequence that encodes the protein or an immunogenic derivative thereof
- ii) transforming a host cell with said vector
- iii) culturing said transformed host cell under conditions permitting expression of said DNA polymer to produce said protein; and
- iv) recovering said protein

[0076] The term 'transforming' is used herein to mean the introduction of foreign DNA into a host cell. This can be achieved for example by transformation, transfection or infection with an appropriate plasmid or viral vector using e.g. conventional techniques as described in *Genetic Engineering*; Eds. S.M. Kingsman and A.J. Kingsman; Blackwell Scientific Publications; Oxford, England, 1988. The term 'transformed' or 'transformant' will hereafter apply to the resulting host cell containing and expressing the foreign gene of interest.

[0077] The expression vectors are novel and also form part of the invention.

[0078] The replicable expression vectors may be prepared in accordance with the invention, by cleaving a vector compatible with the host cell to provide a linear DNA segment having an intact replicon, and combining said linear segment with one or more DNA molecules which, together with said linear segment encode the desired product, such as the DNA polymer encoding the protein of the invention, or derivative thereof, under ligating conditions.

[0079] Thus, the DNA polymer may be performed or formed during the construction of the vector, as desired.

[0080] The choice of vector will be determined in part by the host cell, which may be prokaryotic or eukaryotic but are preferably *E. coli*, yeast or CHO cells. Suitable vectors include plasmids, bacteriophages, cosmids and recombinant viruses. Expression and cloning vectors preferably contain a selectable marker such that only the host cells expressing the marker will survive under selective conditions. Selection genes include but are not limited to the one encoding protein that confer a resistance to ampicillin, tetracycline or kanamycin. Expression vectors also contain control sequences which are compatible with the designated host. For example, expression control sequences for *E. coli*, and more generally for prokaryotes, include promoters and ribosome binding sites. Promoter sequences may be naturally occurring, such as

the β -lactamase (penicillinase) (Weissman 1981, *In Interferon* 3 (ed. L. Gresser), lactose (lac) (Chang et al. Nature, 1977, 198: 1056) and tryptophan (trp) (Goeddel et al. Nucl. Acids Res. 1980, 8, 4057) and lambda-derived P_L promoter system. In addition, synthetic promoters which do not occur in nature also function as bacterial promoters. This is the case for example for the tac synthetic hybrid promoter which is derived from sequences of the trp and lac promoters (De Boer et al., Proc. Natl Acad Sci. USA 1983, 80, 21-26). These systems are particularly suitable with *E. coli*.

[0081] Yeast compatible vectors also carry markers that allow the selection of successful transformants by conferring prototrophy to auxotrophic mutants or resistance to heavy metals on wild-type strains. Expression control sequences for yeast vectors include promoters for glycolytic enzymes (Hess et al., J. Adv. Enzyme Reg. 1968, 7, 149), PH05 gene encoding acid phosphatase, CUP1 gene, ARG3 gene, GAL genes promoters and synthetic promoter sequences. Other control elements useful in yeast expression are terminators and mRNA leader sequences. The 5' coding sequence is particularly useful since it typically encodes a signal peptide comprised of hydrophobic amino acids which direct the secretion of the protein from the cell. Suitable signal sequences can be encoded by genes for secreted yeast proteins such as the yeast invertase gene and the α -factor gene, acid phosphatase, killer toxin, the alpha-mating factor gene and recently the heterologous inulinase signal sequence derived from INU1A gene of *Kluyveromyces marxianus*. Suitable vectors have been developed for expression in *Pichia pastoris* and *Saccharomyces cerevisiae*.

[0082] A variety of *P. pastoris* expression vectors are available based on various inducible or constitutive promoters (Cereghino and Cregg, FEMS Microbiol. Rev. 2000, 24:45-66). For the production of cytosolic and secreted proteins, the most commonly used *P. pastoris* vectors contain the very strong and tightly regulated alcohol oxidase (AOX1) promoter. The vectors also contain the *P. pastoris* histidinol dehydrogenase (HIS4) gene for selection in his4 hosts. Secretion of foreign protein require the presence of a signal sequence and the *S. cerevisiae* prepro alpha mating factor signal sequence has been widely and successfully used in *Pichia* expression system. Expression vectors are integrated into the *P. pastoris* genome to maximize the stability of expression strains. As in *S. cerevisiae*, cleavage of a *P. pastoris* expression vector within a sequence shared by the host genome (AOX1 or HIS4) stimulates homologous recombination events that efficiently target integration of the vector to that genomic locus. In general, a recombinant strain that contains multiple integrated copies of an expression cassette can yield more heterologous protein than single-copy strain. The most effective way to obtain high copy number transformants requires the transformation of *Pichia* recipient strain by the sphaeroplast technique (Cregg et al 1985, Mol. Cell Biol. 5: 3376-3385).

[0083] The preparation of the replicable expression vector may be carried out conventionally with appropriate enzymes for restriction, polymerisation and ligation of the DNA, by procedures described in, for example, Maniatis et al. cited above.

[0084] The recombinant host cell is prepared, in accordance with the invention, by transforming a host cell with a replicable expression vector of the invention under transforming conditions. Suitable transforming conditions are conventional and are described in, for example, Maniatis et al. cited above, or "DNA Cloning" Vol. II, D.M. Glover ed., IRL Press Ltd, 1985.

[0085] The choice of transforming conditions depends upon the choice of the host cell to be transformed. For example, in vivo transformation using a live viral vector as the transforming agent for the polynucleotides of the invention is described above. Bacterial transformation of a host such as *E. coli* may be done by direct uptake of the polynucleotides (which may be expression vectors containing the desired sequence) after the host has been treated with a solution of CaCl_2 (Cohen et al., Proc. Nat. Acad. Sci., 1973, 69, 2110) or with a solution comprising a mixture of rubidium chloride (RbCl), MnCl_2 , potassium acetate and glycerol, and then with 3-[N-morpholino]-propane-sulphonic acid, RbCl and glycerol or by electroporation. Transformation of lower eukaryotic organisms such as yeast cells in culture by direct uptake may be carried out for example by using the method of Hinnen et al (Proc. Natl. Acad. Sci. 1978, 75: 1929-1933). Mammalian cells in culture may be transformed using the calcium phosphate coprecipitation of the vector DNA onto the cells (Graham and Van der Eb, Virology 1978, 52, 546). Other methods for introduction of polynucleotides into mammalian cells include dextran mediated transfection, polybrene mediated transfection, protoplast fusion, electroporation, encapsulation of the polynucleotide(s) into liposomes, and direct microinjection of the polynucleotides into nuclei.

[0086] The invention also extends to a host cell transformed with a nucleic acid encoding the protein of the invention or a replicable expression vector of the invention.

[0087] Culturing the transformed host cell under conditions permitting expression of the DNA polymer is carried out conventionally, as described in, for example, Maniatis et al. and "DNA Cloning" cited above. Thus, preferably the cell is supplied with nutrient and cultured at a temperature below 50°C, preferably between 25°C and 42°C, more preferably between 25°C and 35°C, most preferably at 30°C. The incubation time may vary from a few minutes to a few hours, according to the proportion of the polypeptide in the bacterial cell, as assessed by SDS-PAGE or Western blot.

[0088] The product may be recovered by conventional methods according to the host cell and according to the localisation of the expression product (intracellular or secreted into the culture medium or into the cell periplasm). Thus, where the host cell is bacterial, such as *E. coli* it may, for example, be lysed physically, chemically or enzymatically and the protein product isolated from the resulting lysate. Where the host cell is mammalian, the product may generally be isolated from the nutrient medium or from cell free extracts. Where the host cell is a yeast such as *Saccharomyces cerevisiae* or *Pichia pastoris*, the product may generally be isolated from from lysed cells or from the culture medium,

and then further purified using conventional techniques. The specificity of the expression system may be assessed by western blot or by ELISA using an antibody directed against the polypeptide of interest.

[0089] Conventional protein isolation techniques include selective precipitation, adsorption chromatography, and affinity chromatography including a monoclonal antibody affinity column. When the proteins of the present invention are expressed with a histidine tag (His tag), they can easily be purified by affinity chromatography using an ion metal affinity chromatography column (IMAC) column. The metal ion, may be any suitable ion for example zinc, nickel, iron, magnesium or copper, but is preferably zinc or nickel. Preferably the IMAC buffer contains detergent, preferably an anionic detergent such as SDS, more preferably a non-ionic detergent such as Tween 80, or a zwitterionic detergent such as Empigen BB, as this may result in lower levels of endotoxin in the final product.

[0090] Further chromatographic steps include for example a Q-Sepharose step that may be operated either before or after the IMAC column. Preferably the pH is in the range of 7.5 to 10, more preferably from 7.5 to 9.5, optimally between 8 and 9.

[0091] The proteins of the invention can thus be purified according to the following protocol. After cell disruption, cell extracts containing the protein can be solubilised in a pH 8.5 Tris buffer containing urea (8.0 M for example), and SDS (from 0.5% to 1% for example). After centrifugation, the resulting supernatant may then be loaded onto to an IMAC (Nickel) Sepharose FF column equilibrated with a pH 8.5 Tris buffer. The column may then be washed with a high salt containing buffer (eg 0.75 - 1.5M NaCl, 15 mM pH 8.5 Tris buffer). The column may optionally then be washed again with phosphate buffer without salt. The proteins of the invention may be eluted from the column with an imidazole-containing buffered solution. The proteins can then be submitted to an additional chromatographic step, such as to an anion exchange chromatography (Q Sepharose for example).

[0092] The proteins of the present invention are provided either soluble in a liquid form or in a lyophilised form, which is the preferred form. It is generally expected that each human dose will comprise 1 to 1000 µg of protein, and preferably 30-300 µg. The purification process can also include a carboxyamidation step whereby the protein is first reduced in the presence of Glutathion and then carboxymethylated in the presence of iodoacetamide. This step offers the advantage of controlling the oxidative aggregation of the molecule with itself or with host cell protein contaminants through covalent bridging with disulphide bonds.

[0093] The present invention also provides pharmaceutical and immunogenic compositions comprising a protein of the present invention in a pharmaceutically acceptable excipient.

A preferred vaccine composition comprises at least a protein according to the invention. Said protein has, preferably, blocked thiol groups and is highly purified, e.g. has less than 5% host cell contamination. Such vaccine may optionally contain one or more other tumour-associated antigen and derivatives. For example, suitable other associated antigen include prostate, PAP-1, PSA (prostate specific antigen), PSMA (prostate-specific membrane antigen), PSCA (Prostate Stem Cell Antigen), STEAP.

[0094] In another embodiment, illustrative immunogenic compositions, such as for example vaccine compositions, of the present invention comprise DNA encoding one or more of the fusion polypeptides as described above, such that the fusion polypeptide is generated *in situ*. As noted above, the polynucleotide may be administered within any of a variety of delivery systems known to those of ordinary skill in the art. Indeed, numerous gene delivery techniques are well known in the art, such as those described by Rolland, *Crit. Rev. Therap. Drug Carrier Systems* 15:143-198, 1998, and references cited therein. Appropriate polynucleotide expression systems will, of course, contain the necessary regulatory DNA regulatory sequences for expression in a patient (such as a suitable promoter and terminating signal). Alternatively, bacterial delivery systems may involve the administration of a bacterium (such as *Bacillus-Calmette-Guerrin*) that expresses an immunogenic portion of the polypeptide on its cell surface or secretes such an epitope.

[0095] Therefore, in certain embodiments, polynucleotides encoding immunogenic polypeptides described herein are introduced into suitable mammalian host cells for expression using any of a number of known viral-based systems. In one illustrative embodiment, retroviruses provide a convenient and effective platform for gene delivery systems. A selected nucleotide sequence encoding a polypeptide of the present invention can be inserted into a vector and packaged in retroviral particles using techniques known in the art. The recombinant virus can then be isolated and delivered to a subject. A number of illustrative retroviral systems have been described (e.g., U.S. Pat. No. 5,219,740; Miller and Rosman (1989) *BioTechniques* 7:980-990; Miller, A. D. (1990) *Human Gene Therapy* 1:5-14; Scarpa et al. (1991) *Virology* 180: 849-852; Burns et al. (1993) *Proc. Natl. Acad. Sci. USA* 90:8033-8037; and Boris-Lawrie and Termin (1993) *Cur. Opin. Genet. Develop.* 3:102-109.

[0096] In addition, a number of illustrative adenovirus-based systems have also been described. Unlike retroviruses which integrate into the host genome, adenoviruses persist extrachromosomally thus minimizing the risks associated with insertional mutagenesis (Haj-Ahmad and Graham (1986) *J. Virol.* 57:267-274; Bett et al. (1993) *J. Virol.* 67: 5911-5921; Mittereder et al. (1994) *Human Gene Therapy* 5:717-729; Seth et al. (1994) *J. Virol.* 68:933-940; Barr et al. (1994) *Gene Therapy* 1:51-58; Berkner, K. L. (1988) *BioTechniques* 6:616-629; and Rich et al. (1993) *Human Gene Therapy* 4:461-476). Since humans are sometimes infected by common human adenovirus serotypes such as AdHu5, a significant proportion of the population have a neutralizing antibody response to the adenovirus, which is likely to effect

the immune response to a heterologous antigen in a recombinant vaccine based system. Non-human primate adenoviral vectors such as the chimpanzee adenovirus 68 (AdC68, Fitzgerald et al. (2003) J. Immunol 170(3):1416-22) are may offer an alternative adenoviral system without the disadvantage of a pre-existing neutralising antibody response.

[0097] Various adeno-associated virus (AAV) vector systems have also been developed for polynucleotide delivery. AAV vectors can be readily constructed using techniques well known in the art. See, e.g., U.S. Pat. Nos. 5,173,414 and 5,139,941; International Publication Nos. WO 92/01070 and WO 93/03769; Lebkowski et al. (1988) Molec. Cell. Biol. 8: 3988-3996; Vincent et al. (1990) Vaccines 90 (Cold Spring Harbor Laboratory Press); Carter, B. J. (1992) Current Opinion in Biotechnology 3:533-539; Muzyczka, N. (1992) Current Topics in Microbiol. and Immunol. 158:97-129; Kotin, R. M. (1994) Human Gene Therapy 5:793-801; Shelling and Smith (1994) Gene Therapy 1:165-169; and Zhou et al. (1994) J. Exp. Med. 179:1867-1875.

[0098] Additional viral vectors useful for delivering the nucleic acid molecules encoding polypeptides of the present invention by gene transfer include those derived from the pox family of viruses, such as vaccinia virus and avian poxvirus. By way of example, vaccinia virus recombinants expressing the novel molecules can be constructed as follows. The DNA encoding a polypeptide is first inserted into an appropriate vector so that it is adjacent to a vaccinia promoter and flanking vaccinia DNA sequences, such as the sequence encoding thymidine kinase (TK). This vector is then used to transfect cells which are simultaneously infected with vaccinia. Homologous recombination serves to insert the vaccinia promoter plus the gene encoding the polypeptide of interest into the viral genome. The resulting TK^{sup}(-) recombinant can be selected by culturing the cells in the presence of 5-bromodeoxyuridine and picking viral plaques resistant thereto.

[0099] A vaccinia-based infection/transfection system can be conveniently used to provide for inducible, transient expression or coexpression of one or more polypeptides described herein in host cells of an organism. In this particular system, cells are first infected in vitro with a vaccinia virus recombinant that encodes the bacteriophage T7 RNA polymerase. This polymerase displays exquisite specificity in that it only transcribes templates bearing T7 promoters. Following infection, cells are transfected with the polynucleotide or polynucleotides of interest, driven by a T7 promoter. The polymerase expressed in the cytoplasm from the vaccinia virus recombinant transcribes the transfected DNA into RNA which is then translated into polypeptide by the host translational machinery. The method provides for high level, transient, cytoplasmic production of large quantities of RNA and its translation products. See, e.g., Elroy-Stein and Moss, Proc. Natl. Acad. Sci. USA (1990) 87:6743-6747; Fuerst et al. Proc. Natl. Acad. Sci. USA (1986) 83:8122-8126.

[0100] Alternatively, avipoxviruses, such as the fowlpox and canarypox viruses, can also be used to deliver the coding sequences of interest. Recombinant avipox viruses, expressing immunogens from mammalian pathogens, are known to confer protective immunity when administered to non-avian species. The use of an Avipox vector is particularly desirable in human and other mammalian species since members of the Avipox genus can only productively replicate in susceptible avian species and therefore are not infective in mammalian cells. Methods for producing recombinant Avipoxviruses are known in the art and employ genetic recombination, as described above with respect to the production of vaccinia viruses. See, e.g., WO 91/12862; WO 89/03429; and WO 92/03545.

[0101] Any of a number of alphavirus vectors can also be used for delivery of polynucleotide compositions of the present invention, such as those vectors described in U.S. Patent Nos. 5,843,723; 6,015,686; 6,008,035 and 6,015,694. Certain vectors based on Venezuelan Equine Encephalitis (VEE) can also be used, illustrative examples of which can be found in U.S. Patent Nos. 5,505,947 and 5,643,576.

[0102] The compositions of the present invention can be delivered by a number of routes such as intramuscularly, subcutaneously, intraperitoneally or intravenously.

[0103] In another embodiment of the invention, a polynucleotide is administered/delivered as "naked" DNA, for example as described in Ulmer et al., *Science* 259:1745-1749, 1993 and reviewed by Cohen, *Science* 259:1691-1692, 1993. The uptake of naked DNA may be increased by coating the DNA onto biodegradable beads, which are efficiently transported into the cells. In a preferred embodiment, the composition is delivered intradermally. In particular, the composition is delivered by means of a gene gun (particularly particle bombardment) administration techniques which involve coating the vector on to a bead (eg gold) which are then administered under high pressure into the epidermis; such as, for example, as described in Haynes et al, *J Biotechnology* 44: 37-42 (1996).

[0104] In one illustrative example, gas-driven particle acceleration can be achieved with devices such as those manufactured by Powderject Pharmaceuticals PLC (Oxford, UK) and Powderject Vaccines Inc. (Madison, WI), some examples of which are described in U.S. Patent Nos. 5,846,796; 6,010,478; 5,865,796; 5,584,807; and EP Patent No. 0500 799. This approach offers a needle-free delivery approach wherein a dry powder formulation of microscopic particles, such as polynucleotide, are accelerated to high speed within a helium gas jet generated by a hand held device, propelling the particles into a target tissue of interest, typically the skin. The particles are preferably gold beads of a 0.4 - 4.0 μm , more preferably 0.6 - 2.0 μm diameter and the DNA conjugate coated onto these and then encased in a cartridge or cassette for placing into the "gene gun".

[0105] In a related embodiment, other devices and methods that may be useful for gas-driven needle-less injection of compositions of the present invention include those provided by Bioject, Inc. (Portland, OR), some examples of which are described in U.S. Patent Nos. 4,790,824; 5,064,413; 5,312,335; 5,383,851; 5,399,163; 5,520,639 and 5,993,412.

[0106] It is possible for the immunogen component comprising the nucleotide sequence encoding the antigenic peptide, to be administered on a once off basis or to be administered repeatedly, for example, between 1 and 7 times, preferably between 1 and 4 times, at intervals between about 1 day and about 18 months. However, this treatment regime will be significantly varied depending upon the size of the patient, the disease which is being treated/protected against, the amount of nucleotide sequence administered, the route of administration, and other factors which would be apparent to a skilled medical practitioner.

[0107] It is therefore another aspect of the present invention to provide for the use of a protein or a DNA encoding said protein, as described herein, in the manufacture of an immunogenic composition for eliciting an immune response in a patient. Preferably the immune response is to be elicited by sequential administration of i) the said protein followed by the said DNA sequence, or ii) the said DNA sequence followed by the said protein. More preferably the DNA sequence is coated onto biodegradable beads or delivered via a particle bombardment approach. Still more preferably the protein is adjuvanted, preferably with a TH-1 inducing adjuvant, preferably with a CpG/QS21 based adjuvant formulation.

[0108] The vectors which comprise the nucleotide sequences encoding antigenic peptides are administered in such amount as will be prophylactically or therapeutically effective. The quantity to be administered, is generally in the range of one microgram to 16 milligram, preferably 1 microgram to 10 micrograms for particle-mediated delivery, and 10 micrograms to 16 milligram for other routes of nucleotide per dose. The exact quantity may vary considerably depending on the weight of the patient being immunised and the route of administration.

[0109] Suitable techniques for introducing the naked polynucleotide or vector into a patient also include topical application with an appropriate vehicle. The nucleic acid may be administered topically to the skin, or to mucosal surfaces for example by intranasal, oral, intravaginal or intrarectal administration. The naked polynucleotide or vector may be present together with a pharmaceutically acceptable excipient, such as phosphate buffered saline (PBS). DNA uptake may be further facilitated by use of facilitating agents such as bupivacaine, either separately or included in the DNA formulation. Other methods of administering the nucleic acid directly to a recipient include ultrasound, electrical stimulation, electroporation and microseeding which is described in US 5,697,901.

[0110] Uptake of nucleic acid constructs may be enhanced by several known transfection techniques, for example those including the use of transfection agents. Examples of these agents includes cationic agents, for example, calcium phosphate and DEAE-Dextran and lipofectants, for example, lipofectam and transfectam. The dosage of the nucleic acid to be administered can be altered.

[0111] The fusion proteins and encoding polypeptides according to the invention can also be formulated as a pharmaceutical/immunogenic composition, e.g. as a vaccine. Accordingly therefore, the present invention also provides for a pharmaceutical/immunogenic composition comprising a fusion protein of the present invention in a pharmaceutically acceptable excipient. Accordingly there is also provided a process for the preparation of an immunogenic composition according to the present invention, comprising admixing the fusion protein of the invention or the encoding polynucleotide with a suitable adjuvant, diluent or other pharmaceutically acceptable carrier.

[0112] The fusion proteins of the present invention are provided preferably at least 80% pure more preferably 90% pure as visualised by SDS PAGE. Preferably the proteins appear as a single band by SDS PAGE.

[0113] Vaccine preparation is generally described in Vaccine Design ("The subunit and adjuvant approach" (eds. Powell M.F. & Newman M.J.), (1995) Plenum Press New York). Encapsulation within liposomes is described by Fullerton, US Patent 4,235,877.

[0114] The fusion proteins of the present invention and encoding polynucleotides are preferably adjuvanted in the vaccine formulation of the invention. Certain adjuvants are commercially available as, for example, Freund's Incomplete Adjuvant and Complete Adjuvant (Difco Laboratories, Detroit, MI); Merck Adjuvant 65 (Merck and Company, Inc., Rahway, NJ); AS-2 (SmithKline Beecham, Philadelphia, PA); aluminum salts such as aluminum hydroxide gel (alum) or aluminum phosphate; salts of calcium, iron or zinc; an insoluble suspension of acylated tyrosine; acylated sugars; cationically or anionically derivatised polysaccharides; polyphosphazenes; biodegradable microspheres; monophosphoryl lipid A and quil A. Cytokines, such as GM-CSF, interleukin-2, -7, -12, and other like growth factors, may also be used as adjuvants.

[0115] Within certain embodiments of the invention, the adjuvant composition is preferably one that induces an immune response predominantly of the Th1 type. High levels of Th1-type cytokines (e.g., IFN- γ , TNF α , IL-2 and IL-12) tend to favor the induction of cell mediated immune responses to an administered antigen. In contrast, high levels of Th2-type cytokines (e.g., IL-4, IL-5, IL-6 and IL-10) tend to favor the induction of humoral immune responses. Following application of a vaccine as provided herein, a patient will support an immune response that includes Th1- and Th2-type responses. Within a preferred embodiment, in which a response is predominantly Th1-type, the level of Th1-type cytokines will increase to a greater extent than the level of Th2-type cytokines. The levels of these cytokines may be readily assessed using standard assays. For a review of the families of cytokines, see Mosmann and Coffman, *Ann. Rev. Immunol.* 7: 145-173, 1989.

[0116] Preferred TH-1 inducing adjuvants are selected from the group of adjuvants comprising: 3D-MPL, QS21, a mixture of QS21 and cholesterol, and a CpG oligonucleotide or a mixture of two or more said adjuvants. Certain preferred adjuvants for eliciting a predominantly Th1-type response include, for example, a combination of monophosphoryl lipid

A, preferably 3-de-O-acylated monophosphoryl lipid A, together with an aluminum salt. MPL® adjuvants are available from Corixa Corporation (Seattle, WA; see, for example, US Patent Nos. 4,436,727, 4,877,611; 4,866,034 and 4,912,094). CpG-containing oligonucleotides (in which the CpG dinucleotide is unmethylated) also induce a predominantly Th1 response. Such oligonucleotides are well known and are described, for example, in WO 96/02555, WO 99/33488 and U.S. Patent Nos. 6,008,200 and 5,856,462. Immunostimulatory DNA sequences are also described, for example, by Sato et al., *Science* 273:352, 1996. Another preferred adjuvant comprises a saponin, such as Quil A, or derivatives thereof, including QS21 and QS7 (Aquila Biopharmaceuticals Inc., Framingham, MA); Escin; Digitonin; or *Gypsophila* or *Chenopodium quinoa* saponins. Other preferred formulations include more than one saponin in the adjuvant combinations of the present invention, for example combinations of at least two of the following group comprising QS21, QS7, Quil A, β -escin, or digitonin.

[0117] Alternatively the saponin formulations may be combined with vaccine vehicles composed of chitosan or other polycationic polymers, polylactide and poly(lactide-co-glycolide) particles, poly-N-acetyl glucosamine-based polymer matrix, particles composed of polysaccharides or chemically modified polysaccharides, liposomes and lipid-based particles, particles composed of glycerol monoesters, etc. The saponins may also be formulated in the presence of cholesterol to form particulate structures such as liposomes or ISCOMs. Furthermore, the saponins may be formulated together with a polyoxyethylene ether or ester, in either a non-particulate solution or suspension, or in a particulate structure such as a paucilamellar liposome or ISCOM. The saponins may also be formulated with excipients such as Carbopol® to increase viscosity, or may be formulated in a dry powder form with a powder excipient such as lactose.

[0118] In one preferred embodiment, the adjuvant system includes the combination of a monophosphoryl lipid A and a saponin derivative, such as the combination of QS21 and 3D-MPL® adjuvant, as described in WO 94/00153, or a less reactogenic composition where the QS21 is quenched with cholesterol, as described in WO 96/33739. Other preferred formulations comprise an oil-in-water emulsion and tocopherol. Another particularly preferred adjuvant formulation employing QS21, 3D-MPL® adjuvant and tocopherol in an oil-in-water emulsion is described in WO 95/17210.

[0119] Another enhanced adjuvant system involves the combination of a CpG-containing oligonucleotide and a saponin derivative particularly the combination of CpG and QS21 as disclosed in WO 00/09159 and in WO 00/62800. Preferably the formulation additionally comprises an oil in water emulsion and tocopherol.

[0120] In a yet further embodiment the present invention provides an immunogenic composition comprising a fusion protein according to the invention, and further comprising D3-MPL, a saponin preferably QS21 and a CpG oligonucleotide, optionally formulated in an oil in water emulsion.

[0121] Additional illustrative adjuvants for use in the pharmaceutical compositions of the invention include Montanide ISA 720 (Seppic, France), SAF (Chiron, California, United States), ISCOMS (CSL, MF-59 (Chiron), the SBAS series of adjuvants (e.g., SBAS-2 or SBAS-4, available from SmithKline Beecham, Rixensart, Belgium), Detox (Enhancyn® (Corixa, Hamilton, MT), RC-529 (Corixa, Hamilton, MT) and other aminoalkyl glucosaminide 4-phosphates (AGPs), such as those described in pending U.S. Patent Application Serial Nos. 08/853,826 and 09/074,720, the disclosures of which are incorporated herein by reference in their entireties, and polyoxyethylene ether adjuvants such as those described in WO 99/52549A1.

[0122] Other preferred adjuvants include adjuvant molecules of the general formula (I): $\text{HO}(\text{CH}_2\text{CH}_2\text{O})_n\text{-A-R}$, wherein, n is 1-50, A is a bond or -C(O)-, R is C_{1-50} alkyl or Phenyl C_{1-50} alkyl. One embodiment of the present invention consists of a vaccine formulation comprising a polyoxyethylene ether of general formula (I), wherein n is between 1 and 50, preferably 4-24, most preferably 9; the R component is C_{1-50} , preferably C_{4-20} alkyl and most preferably C_{12} alkyl, and A is a bond. The concentration of the polyoxyethylene ethers should be in the range 0.1-20%, preferably from 0.1-10%, and most preferably in the range 0.1-1%. Preferred polyoxyethylene ethers are selected from the following group: polyoxyethylene-9-lauryl ether, polyoxyethylene-9-stearyl ether, polyoxyethylene-8-stearyl ether, polyoxyethylene-4-lauryl ether, polyoxyethylene-35-lauryl ether, and polyoxyethylene-23-lauryl ether. Polyoxyethylene ethers such as polyoxyethylene lauryl ether are described in the Merck index (12th edition: entry 7717). These adjuvant molecules are described in WO 99/52549. The polyoxyethylene ether according to the general formula (I) above may, if desired, be combined with another adjuvant. For example, a preferred adjuvant combination is preferably with CpG as described in the pending UK patent application GB 9820956.2.

[0123] It is an embodiment of the invention that the antigens, including nucleic acid vector, of the invention be utilised with immunostimulatory agent. Preferably the immunostimulatory agent is administered at the same time as the antigens of the invention and in preferred embodiments are formulated together. It is another embodiment of the invention that the antigen and immunostimulatory agent (or vice versa) are administered sequentially to the same or adjacent sites, separated in time by periods of between 0-100 hours. Such immunostimulatory agents include but are not limited to: synthetic imidazoquinolines such as imiquimod [S-26308, R-837] (Harrison, et al., *Vaccine* 19: 1820-1826, 2001, and resiquimod [S-28463, R-848] (Vasilakos, et al., *Cellular Immunology* 204: 64-74, 2000; Schiff bases of carbonyls and amines that are constitutively expressed on antigen presenting cell and T-cell surfaces, such as tucareosol (Rhodes, J. et al., *Nature* 377: 71-75, 1995), cytokine, chemokine and co-stimulatory molecules as either protein or peptide, including for example pro-inflammatory cytokines such as Interferon, GM-CSF, IL-1 alpha, IL-1 beta, TGF- alpha and TGF - beta,

Th1 inducers such as interferon gamma, IL-2, IL-12, IL-15, IL-18 and IL-21, Th2 inducers such as IL-4, IL-5, IL-6, IL-10 and IL-13 and other chemokine and co-stimulatory genes such as MCP-1, MIP-1 alpha, MIP-1 beta, RANTES, TCA-3, CD80, CD86 and CD40L, other immunostimulatory targeting ligands such as CTLA-4 and L-selectin, apoptosis stimulating proteins and peptides such as Fas, (49), synthetic lipid based adjuvants, such as vaxfectin, (Reyes et al., Vaccine 19: 3778-3786, 2001) squalene, alpha-tocopherol, polysorbate 80, DOPC and cholesterol, endotoxin, [LPS] (Beutler, B., Current Opinion in Microbiology 3: 23-30, 2000); CpG oligo- and di-nucleotides (Sato, Y. et al., Science 273 (5273): 352-354, 1996; Hemmi, H. et al., Nature 408: 740-745, 2000) and other potential ligands that trigger Toll receptors to produce Th1-inducing cytokines, such as synthetic Mycobacterial lipoproteins, Mycobacterial protein p19, peptidoglycan, teichoic acid and lipid A.

[0124] Other suitable adjuvant include CT (cholera toxin, subunits A and B) and LT (heat labile enterotoxin from E. coli, subunits A and B), heat shock protein family (HSPs), and LLO (listeriolysin O; WO 01/72329).

[0125] Where the immunostimulatory agent is a protein, the agent may be administered either as a protein or as a polynucleotide encoding the protein.

[0126] Other suitable delivery systems include microspheres wherein the antigenic material is incorporated into or conjugated to biodegradable polymers/microspheres so that the antigenic material can be mixed with a suitable pharmaceutical carrier and used as a vaccine. The term "microspheres" is generally employed to describe colloidal particles which are substantially spherical and have a diameter in the range 10 nm to 2 mm. Microspheres made from a very wide range of natural and synthetic polymers have found use in a variety of biomedical applications. This delivery system is especially advantageous for proteins having short half-lives in vivo requiring multiple treatments to provide efficacy, or being unstable in biological fluids or not fully absorbed from the gastrointestinal tract because of their relatively high molecular weights. Several polymers have been described as a matrix for protein release. Suitable polymers include gelatin, collagen, alginate, dextran. Preferred delivery systems include biodegradable poly(DL-lactic acid) (PLA), poly(lactide-co-glycolide) (PLG), poly(glycolic acid) (PGA), poly(e-caprolactone) (PCL), and copolymers poly(DL-lactic-co-glycolic acid) (PLGA). Other preferred systems include heterogeneous hydrogels such as poly(ether ester) multiblock copolymers, containing repeating blocks based on hydrophilic poly-(ethylene glycol) (PEG) and hydrophobic poly(butylene terephthalate) (PBT), or poly(ethylene glycol)-terephthalate/poly-(butylene terephthalate) (PEGT/PBT) (Sohier et al. Eur. J. Pharm and Biopharm, 2003, 55, 221-228). Systems are preferred which provide a sustained release for 1 to 3 months such as PLGA, PLA and PEGT/PBT.

[0127] It is possible for the immunogenic or vaccine composition to be administered on a once off basis or, preferably, to be administered repeatedly, as many times as necessary, for example, between 1 and 7 times, preferably between 1 and 4 times, at intervals between about 1 day and about 18 months, preferably one month. This may be optionally followed by dosing at regular intervals of between 1 and 12 months for a period up to the remainder of the patient's life. In a preferred embodiment the patient receives the antigen in different forms in a "prime boost" regime. Thus for example the antigen, the fusion protein, is first administered as a protein adjuvant base formulation and then subsequently administered as a DNA based vaccine. This administration mode is preferred. The preferred adjuvant is a combination of a CpG-containing oligonucleotide and a saponin derivative, particularly the combination of CpG and QS21 as disclosed in WO 00/09159 and in WO 00/62800. The uptake of naked DNA may be increased by coating the DNA onto biodegradable beads, which are efficiently transported into the cells. Alternatively the DNA can be delivered via a particle bombardment approach, for example, gas-driven particle acceleration with devices such as those manufactured by Powderject Pharmaceuticals PLC (Oxford, UK) and Powderject Vaccines Inc. (Madison, WI) as taught herein. This approach offers a needle-free delivery approach wherein a dry powder formulation of microscopic particles, such as polynucleotide or polypeptide particles, are accelerated to high speed within a helium gas jet generated by a hand held device, propelling the particles into a target tissue of interest.

[0128] In another preferred embodiment, the DNA based vaccine will be administered first, followed by the protein adjuvant base formulation. Still another embodiment will concern the delivery of the DNA construct by means of specialised delivery vectors, preferably by the means of viral system, most preferably by the means of adenoviral-based systems. Other suitable viral-based systems of DNA delivery include retroviral, lentiviral, adeno-associated viral, herpes viral and vaccinia-viral based systems.

[0129] In another preferred embodiment, the protein adjuvant base formulation and DNA based vaccine may be co-administered at adjacent or overlapping sites. Dependent upon the nature of the DNA vaccine formulation, this can be achieved by mixing the DNA and protein adjuvant formulations prior to administration or by simultaneously administration of the DNA and protein adjuvant formulation.

[0130] The treatment regime will be significantly varied depending upon the size and species of patient concerned, the amount of nucleic acid vaccine and / or protein composition administered, the route of administration, the potency and dose of any adjuvant compounds used and other factors which would be apparent to a skilled medical practitioner.

[0131] Within further aspects, the present invention provides methods for stimulating an immune response in a patient, preferably a T cell response in a human patient, comprising administering a pharmaceutical composition described herein. The patient may be afflicted with lung or colon cancer or colorectal cancer or breast cancer, in which case the

methods provide treatment for the disease, or patient considered at risk for such a disease may be treated prophylactically.

[0132] Within further aspects, the present invention provides methods for inhibiting the development of a cancer in a patient, comprising administering to a patient a pharmaceutical composition as recited above. The patient may be afflicted with, for example, sarcoma, prostate, ovarian, bladder, lung, colon, colorectal or breast cancer, in which case the methods

provide treatment for the disease, or patient considered at risk for such a disease may be treated prophylactically.

[0133] The present invention further provides, within other aspects, methods for removing tumour cells from a biological sample, comprising contacting a biological sample with T cells that specifically react with a polypeptide of the present invention, wherein the step of contacting is performed under conditions and for a time sufficient to permit the removal of cells expressing the protein from the sample.

[0134] Within related aspects, methods are provided for inhibiting the development of a cancer in a patient, comprising administering to a patient a biological sample treated as described above.

[0135] Methods are further provided, within other aspects, for stimulating and/or expanding T cells specific for a polypeptide of the present invention, comprising contacting T cells with one or more of: (i) a polypeptide as described above; (ii) a polynucleotide encoding such a polypeptide; and/or (iii) an antigen presenting cell that expresses such a polypeptide; under conditions and for a time sufficient to permit the stimulation and/or expansion of T cells. Isolated T cell populations comprising T cells prepared as described above are also provided.

[0136] Within further aspects, the present invention provides methods for inhibiting the development of a cancer in a patient, comprising administering to a patient an effective amount of a T cell population as described above.

The present invention further provides methods for inhibiting the development of a cancer in a patient, comprising the steps of: (a) incubating CD4+ and/or CD8+ T cells isolated from a patient with one or more of: (i) a polypeptide disclosed herein; (ii) a polynucleotide encoding such a polypeptide; and (iii) an antigen-presenting cell that expressed such a polypeptide; and (b) administering to the patient an effective amount of the proliferated T cells, and thereby inhibiting the development of a cancer in the patient. Proliferated cells may, but need not, be cloned prior to administration to the patient.

[0137] According to another embodiment of this invention, an immunogenic composition described herein is delivered to a host via antigen presenting cells (APCs), such as dendritic cells, macrophages, B cells, monocytes and other cells that may be engineered to be efficient APCs. Such cells may, but need not, be genetically modified to increase the capacity for presenting the antigen, to improve activation and/or maintenance of the T cell response, to have anti-tumor effects *per se* and/or to be immunologically compatible with the receiver (*i.e.*, matched HLA haplotype). APCs may generally be isolated from any of a variety of biological fluids and organs, including tumor and peritumoral tissues, and may be autologous, allogeneic, syngeneic or xenogeneic cells.

[0138] Certain preferred embodiments of the present invention use dendritic cells or progenitors thereof as antigen-presenting cells. Dendritic cells are highly potent APCs (Banchereau and Steinman, *Nature* 392:245-251, 1998) and have been shown to be effective as a physiological adjuvant for eliciting prophylactic or therapeutic antitumor immunity (see Timmerman and Levy, *Ann. Rev. Med.* 50:507-529, 1999). In general, dendritic cells may be identified based on their typical shape (stellate *in situ*, with marked cytoplasmic processes (dendrites) visible *in vitro*), their ability to take up, process and present antigens with high efficiency and their ability to activate naive T cell responses. Dendritic cells may, of course, be engineered to express specific cell-surface receptors or ligands that are not commonly found on dendritic cells *in vivo* or *ex vivo*, and such modified dendritic cells are contemplated by the present invention. As an alternative to dendritic cells, secreted vesicles antigen-loaded dendritic cells (called exosomes) may be used within a vaccine (see Zitvogel et al., *Nature Med.* 4:594-600, 1998).

[0139] Dendritic cells and progenitors may be obtained from peripheral blood, bone marrow, tumor-infiltrating cells, peritumoral tissues-infiltrating cells, lymph nodes, spleen, skin, umbilical cord blood or any other suitable tissue or fluid. For example, dendritic cells may be differentiated *ex vivo* by adding a combination of cytokines such as GM-CSF, IL-4, IL-13 and/or TNF α to cultures of monocytes harvested from peripheral blood. Alternatively, CD34 positive cells harvested from peripheral blood, umbilical cord blood or bone marrow may be differentiated into dendritic cells by adding to the culture medium combinations of GM-CSF, IL-3, TNF α , CD40 ligand, LPS, flt3 ligand and/or other compound(s) that induce differentiation, maturation and proliferation of dendritic cells.

[0140] Dendritic cells are conveniently categorized as "immature" and "mature" cells, which allows a simple way to discriminate between two well characterized phenotypes. However, this nomenclature should not be construed to exclude all possible intermediate stages of differentiation. Immature dendritic cells are characterized as APC with a high capacity for antigen uptake and processing, which correlates with the high expression of Fey receptor and mannose receptor. The mature phenotype is typically characterized by a lower expression of these markers, but a high expression of cell surface molecules responsible for T cell activation such as class I and class II MHC, adhesion molecules (*e.g.*, CD54 and CD11) and costimulatory molecules (*e.g.*, CD40, CD80, CD86 and 4-1 BB).

[0141] APCs may generally be transfected with a polynucleotide of the invention (or portion or other variant thereof) such that the encoded polypeptide, or an immunogenic portion thereof, is expressed on the cell surface. Such transfection may take place *ex vivo*, and a pharmaceutical composition comprising such transfected cells may then be used for

therapeutic purposes, as described herein. Alternatively, a gene delivery vehicle that targets a dendritic or other antigen presenting cell may be administered to a patient, resulting in transfection that occurs *in vivo*. *In vivo* and *ex vivo* transfection of dendritic cells, for example, may generally be performed using any methods known in the art, such as those described in WO 97/24447, or the gene gun approach described by Mahvi et al., *Immunology and cell Biology* 75:456-460, 1997.

5 Antigen loading of dendritic cells may be achieved by incubating dendritic cells or progenitor cells with the tumor polypeptide, DNA (naked or within a plasmid vector) or RNA; or with antigen-expressing recombinant bacterium or viruses (e.g., vaccinia, fowlpox, adenovirus or lentivirus vectors). Prior to loading, the polypeptide may be covalently conjugated to an immunological partner that provides T cell help (e.g., a carrier molecule). Alternatively, a dendritic cell may be pulsed with a non-conjugated immunological partner, separately or in the presence of the polypeptide.

Definitions

[0142] Also provided by the invention are methods for the analysis of character sequences or strings, particularly genetic sequences or encoded protein sequences. Preferred methods of sequence analysis include, for example, methods of sequence homology analysis, such as identity and similarity analysis, DNA, RNA and protein structure analysis, sequence assembly, cladistic analysis, sequence motif analysis, open reading frame determination, nucleic acid base calling, codon usage analysis, nucleic acid base trimming, and sequencing chromatogram peak analysis.

[0143] A computer based method is provided for performing homology identification. This method comprises the steps of: providing a first polynucleotide sequence comprising the sequence of a polynucleotide of the invention in a computer readable medium; and comparing said first polynucleotide sequence to at least one second polynucleotide or polypeptide sequence to identify homology. A computer based method is also provided for performing homology identification, said method comprising the steps of: providing a first polypeptide sequence comprising the sequence of a polypeptide of the invention in a computer readable medium; and comparing said first polypeptide sequence to at least one second polynucleotide or polypeptide sequence to identify homology.

[0144] "Identity," as known in the art, is a relationship between two or more polypeptide sequences or two or more polynucleotide sequences, as the case may be, as determined by comparing the sequences. In the art, "identity" also means the degree of sequence relatedness between polypeptide or polynucleotide sequences, as the case may be, as determined by the match between strings of such sequences. "Identity" can be readily calculated by known methods, including but not limited to those described in (*Computational Molecular Biology*, Lesk, A.M., ed., Oxford University Press, New York, 1988; *Biocomputing: Informatics and Genome Projects*, Smith, D.W., ed., Academic Press, New York, 1993; *Computer Analysis of Sequence Data*, Part I, Griffin, A.M., and Griffin, H.G., eds., Humana Press, New Jersey, 1994; *Sequence Analysis in Molecular Biology*, von Heine, G., Academic Press, 1987; and *Sequence Analysis Primer*, Gribskov, M. and Devereux, J., eds., M Stockton Press, New York, 1991; and Carillo, H., and Lipman, D., *SIAM J. Applied Math.*, 48: 1073 (1988). Methods to determine identity are designed to give the largest match between the sequences tested. Moreover, methods to determine identity are codified in publicly available computer programs. Computer program methods to determine identity between two sequences include, but are not limited to, the GAP program in the GCG program package (Devereux, J., et al., *Nucleic Acids Research* 12(1): 387 (1984)), BLASTP, BLASTN (Altschul, S.F. et al., *J. Molec. Biol.* 215: 403-410 (1990), and FASTA (Pearson and Lipman Proc. Natl. Acad. Sci. USA 85: 2444-2448 (1988). The BLAST family of programs is publicly available from NCBI and other sources (*BLAST Manual*, Altschul, S., et al., NCBI NLM NIH Bethesda, MD 20894; Altschul, S., et al., *J. Mol. Biol.* 215: 403-410 (1990). The well known Smith Waterman algorithm may also be used to determine identity.

[0145] Parameters for polypeptide sequence comparison include the following:

Algorithm: Needleman and Wunsch, *J. Mol Biol.* 48: 443-453 (1970)

Comparison matrix: BLOSSUM62 from Henikoff and Henikoff,

Proc. Natl. Acad. Sci. USA. 89:10915-10919 (1992)

Gap Penalty: 8

Gap Length Penalty: 2

A program useful with these parameters is publicly available as the "gap" program from Genetics Computer Group, Madison WI. The aforementioned parameters are the default parameters for peptide comparisons (along with no penalty for end gaps).

[0146] Parameters for polynucleotide comparison include the following:

Algorithm: Needleman and Wunsch, *J. Mol Biol.* 48: 443-453 (1970)

Comparison matrix: matches = +10, mismatch = 0

Gap Penalty: 50

Gap Length Penalty: 3

Available as: The "gap" program from Genetics Computer Group, Madison WI. These are the default parameters for nucleic acid comparisons.

[0147] A preferred meaning for "identity" for polynucleotides and polypeptides, as the case may be, are provided in (1) and (2) below.

(1) Polynucleotide embodiments further include an isolated polynucleotide comprising a polynucleotide sequence having at least a 50, 60, 70, 80, 85, 90, 95, 97 or 100% identity to any of the reference sequences of SEQ ID NO: 9 to SEQ ID NO:16, wherein said polynucleotide sequence may be identical to any of the reference sequences of SEQ ID NO:9 to SEQ ID NO:16 or may include up to a certain integer number of nucleotide alterations as compared to the reference sequence, wherein said alterations are selected from the group consisting of at least one nucleotide deletion, substitution, including transition and transversion, or insertion, and wherein said alterations may occur at the 5' or 3' terminal positions of the reference nucleotide sequence or anywhere between those terminal positions, interspersed either individually among the nucleotides in the reference sequence or in one or more contiguous groups within the reference sequence, and wherein said number of nucleotide alterations is determined by multiplying the total number of nucleotides in any of SEQ ID NO:9 to SEQ ID NO:16 by the integer defining the percent identity divided by 100 and then subtracting that product from said total number of nucleotides in any of SEQ ID NO:9 to SEQ ID NO:16, or:

$$n_n \leq x_n - (x_n \cdot y),$$

wherein n_n is the number of nucleotide alterations, x_n is the total number of nucleotides in any of SEQ ID NO:9 to SEQ ID NO:16, y is 0.50 for 50%, 0.60 for 60%, 0.70 for 70%, 0.80 for 80%, 0.85 for 85%, 0.90 for 90%, 0.95 for 95%, 0.97 for 97% or 1.00 for 100%, and \cdot is the symbol for the multiplication operator, and wherein any non-integer product of x_n and y is rounded down to the nearest integer prior to subtracting it from x_n . Alterations of polynucleotide sequences encoding the polypeptides of any of SEQ ID NO:1 to SEQ ID NO:8 may create nonsense, missense or frameshift mutations in this coding sequence and thereby alter the polypeptide encoded by the polynucleotide following such alterations.

By way of example, a polynucleotide sequence of the present invention may be identical to any of the reference sequences of SEQ ID NO:9 to SEQ ID NO:16, that is it may be 100% identical, or it may include up to a certain integer number of nucleic acid alterations as compared to the reference sequence such that the percent identity is less than 100% identity. Such alterations are selected from the group consisting of at least one nucleic acid deletion, substitution, including transition and transversion, or insertion, and wherein said alterations may occur at the 5' or 3' terminal positions of the reference polynucleotide sequence or anywhere between those terminal positions, interspersed either individually among the nucleic acids in the reference sequence or in one or more contiguous groups within the reference sequence. The number of nucleic acid alterations for a given percent identity is determined by multiplying the total number of nucleic acids in any of SEQ ID NO:9 to SEQ ID NO:16 by the integer defining the percent identity divided by 100 and then subtracting that product from said total number of nucleic acids in any of SEQ ID NO:9 to SEQ ID NO:16, or:

$$n_n \leq x_n - (x_n \cdot y),$$

wherein n_n is the number of nucleic acid alterations, x_n is the total number of nucleic acids in any of SEQ ID NO:9 to SEQ ID NO:16, y is, for instance 0.70 for 70%, 0.80 for 80%, 0.85 for 85% etc., \cdot is the symbol for the multiplication operator, and wherein any non-integer product of x_n and y is rounded down to the nearest integer prior to subtracting it from x_n .

(2) Polypeptide embodiments further include an isolated polypeptide comprising a polypeptide having at least a 50, 60, 70, 80, 85, 90, 95, 97 or 100% identity to the polypeptide reference sequence of any of SEQ ID NO:1 to SEQ ID NO:8, wherein said polypeptide sequence may be identical to any of the reference sequence of SEQ ID NO:1 to SEQ ID NO:8 or may include up to a certain integer number of amino acid alterations as compared to the reference sequence, wherein said alterations are selected from the group consisting of at least one amino acid deletion, substitution, including conservative and non-conservative substitution, or insertion, and wherein said alterations may occur at the amino- or carboxy-terminal positions of the reference polypeptide sequence or anywhere between those terminal positions, interspersed either individually among the amino acids in the reference sequence or in

one or more contiguous groups within the reference sequence, and wherein said number of amino acid alterations is determined by multiplying the total number of amino acids in any of SEQ ID NO:1 to SEQ ID NO:8 by the integer defining the percent identity divided by 100 and then subtracting that product from said total number of amino acids in any of SEQ ID NO:1 to SEQ ID NO:8, or:

$$n_a \leq x_a - (x_a \cdot y).$$

wherein n_a is the number of amino acid alterations, x_a is the total number of amino acids in SEQ ID NO:2, y is 0.50 for 50%, 0.60 for 60%, 0.70 for 70%, 0.80 for 80%, 0.85 for 85%, 0.90 for 90%, 0.95 for 95%, 0.97 for 97% or 1.00 for 100%, and \cdot is the symbol for the multiplication operator, and wherein any non-integer product of x_a and y is rounded down to the nearest integer prior to subtracting it from x_a .

[0148] By way of example, a polypeptide sequence of the present invention may be identical to the reference sequence of any of SEQ ID NO:1 to SEQ ID NO:8, that is it may be 100% identical, or it may include up to a certain integer number of amino acid alterations as compared to the reference sequence such that the percent identity is less than 100% identity. Such alterations are selected from the group consisting of at least one amino acid deletion, substitution, including conservative and non-conservative substitution, or insertion, and wherein said alterations may occur at the amino- or carboxy-terminal positions of the reference polypeptide sequence or anywhere between those terminal positions, interspersed either individually among the amino acids in the reference sequence or in one or more contiguous groups within the reference sequence. The number of amino acid alterations for a given % identity is determined by multiplying the total number of amino acids in any of SEQ ID NO:1 to SEQ ID NO:8 by the integer defining the percent identity divided by 100 and then subtracting that product from said total number of amino acids in any of SEQ ID NO:1 to SEQ ID NO:8, or:

$$n_a \leq x_a - (x_a \cdot y).$$

wherein n_a is the number of amino acid alterations, x_a is the total number of amino acids in any of SEQ ID NO:1 to SEQ ID NO:8, y is, for instance 0.70 for 70%, 0.80 for 80%, 0.85 for 85% etc., and \cdot is the symbol for the multiplication operator, and wherein any non-integer product of x_a and y is rounded down to the nearest integer prior to subtracting it from x_a .

Figure legends

[0149]

Figure 1: Sequence information for C-LytA. Each repeat has been defined on the basis of both multiple sequence alignment and secondary structure prediction using the following alignment programs: 1) MatchBox (Depiereux E et al. (1992) Comput Applic Biosci 8:501-9); 2) ClustalW (Thompson JD et al. (1994) Nucl Acid Res 22:4673-80); 3) Block-Maker (Henikoff S et al (1995) Gene 163:gc17-26)

Subsequently bleeds were taken at day 28 and day 49 (mice A1-3, B1-3) and day 56 (mice A4-6, B4-9). All sera was tested at 1/100 dilution. The results for the pVAC immunised mice were averaged. The results for the individual pVAC-P501 S immunised mice are shown. As a positive control, sera from Adeno-P501 S immunised mice (Corixa Corp, diluted 1/100) is included. Figure 23: Peptide library screen using C57BL/6 mice immunised at day 0, 21, 42, and 70 with pVAC-P501 S (JNW680). All peptides were used at a final concentration of 50µg/ml. Peptides 1-50 are overlapping 15-20mers obtained from Corixa. Peptides 51-70 are predicted 8-9mer Kb and Db epitopes and were ordered from Mimotopes (UK). Samples 71-72 and 73-78 are DMSO controls and no peptide controls respectively. Graph A shows the IFN-γ responses whilst Graph B shows the IL-2 responses. Peptides selected for use in subsequent immunoassays are shown in black.

Figure 24: Cellular responses by ELISPOT at day 77 following PMID immunisation at day 0, 21, 42, and 70 with pVAC-P501S (JNW680, B6-9) and pVAC empty (A4-6). Peptide 18, 22 & 48 were used at 50µg/ml. CPC-P501 S protein was used at 20µg/ml. Graph A shows the IFN-γ responses whilst Graph B shows the IL-2 responses.

Figure 25: Comparison of P501 S and CPC-P501 S. Cellular responses were measured by IL-2 ELISPOT using peptide 22 (10µg/ml) at day 28. Mice were immunised by PMID at day 0 and 21 with pVAC empty (control), pVAC-P501 S (JNW680) and CPC-P501 S (JNW735).

[0150] The invention will be further described by reference to the following examples:

EXAMPLE I: Preparation of the recombinant Yeast strain Y1796 expressing P501 Fusion Protein containing a C-LyIA-P2-C-LyIA (CPC) as fusion partner

1. - Protein design

[0151] The structure of the fusion protein C-P2-C-p501 (alternatively named CPC-P501) to be expressed in *S. cerevisiae* is depicted in figure 3. This fusion contains the C-terminal region of gene LytA (residues 187 to 306), in which the P2 fragment of tetanus toxin (residues 830-843) has been inserted. The P2 fragment is placed between the residues 277 and 278 of C-LyIA. The C-LyIA fragment containing the P2 insertion is followed by P501 (residues amino acid 51 to 553) and by the His tail.

[0152] The primary structure of the resulting fusion protein has the sequence described in figure 4 and the coding sequence corresponding to the above protein design is in figure 5.

2. - Cloning strategy for the generation of a yeast plasmid expressing CPC-P501 (51-553)-His fusion protein

[0153]

- The starting material is the yeast vector pRIT15068 (UK patent application 0015619.0).
- This vector contains the yeast Cup1 promoter, the yeast alpha prepro signal coding sequence and the coding sequence corresponding to residues 55 to 553 of P501S followed by His tail.
- The cloning strategy outlined in figure 6 include the following steps:

- a) The first step is the insertion of P2 sequence (codon-optimised for yeast expression) in frame, inside the C-LyIA coding sequence. The C-LyIA coding sequence is harbored by plasmid pRIT 14662 (PCT/EP99/00860). The insertion is done using an adaptor formed by two complementary oligonucleotides named P21 and P22 into the plasmid pRIT 14662 previously open by NcoI
- The sequence of P21 and P22 is:

P21 5' catgaatacatcaaggcctaactcaagttcatgttactgactgaagcggt 3'
 P22 3' gttatgtgtccgattgagattcaagtaacctagtgacttcgcagttac 5'

After ligation and transformation of *E. coli* and transformant characterization, the plasmid named pRIT15199 is obtained.

b) The second step is the preparation of C-lytA-P2-C-lytA DNA fragment by PCR amplification. The amplification is performed using pRIT15199 as template and the oligonucleotides named C-LytANOTATG and C-LytA-aa55. The sequence of both oligonucleotides being:

C-LytANOTATG

=5'aaacacatggcggttactgacttcacgttcgacggtcttattccaaagcaag 3'

C-LytA-aa55 =5'aaacatgtacatgaactttctggcctgctgctcaggtgttc 3'

The amplified fragment is treated with the restriction enzymes NcoI and Afl III to generate the respective cohesive ends.

c) The next step is the ligation of the above fragment with vector pRIT15068 (largest fragment obtained after NcoI treatment) to generate the complete fusion protein coding sequence. After ligation and *E. coli* transformation the plasmid named pRIT15200 is obtained. In this plasmid the remaining unique NcoI site contains the ATG coding for the start codon.

d) In the next step a NcoI fragment containing the CUP1 promoter and a portion of 2 μ plasmid sequences is prepared from plasmid pRIT 15202. Plasmid pRIT 15202 is a yeast 2 μ derivative containing the CUP1 promoter with an NcoI site at ATG (ATG sequence: AAACC ATG)

e) The NcoI fragment isolated from pRIT 15202 is ligated to pRIT15200, previously open with NcoI, in the right orientation, in such a way the pCUP1 promoter is at the 5' side of the coding sequence. This results in the generation of a final expression plasmid named pRIT15201 (see figure 7).

3. - Preparation of the recombinant yeast strain Y1796 (RIX4440)

[0154] The plasmid pRIT 15201 is used to transform the *S. cerevisiae* strain DC5 (ATCC 20820). After selection and characterisation of the yeast transformants containing the plasmid pRIT 15201 a recombinant yeast strain named Y1796 expressing CPC-P501-His fusion protein is obtained. The protein after reduction and carboxyamidation, is isolated and purified by affinity chromatography (IMAC) followed by anion exchange chromatography (Q Sepharose FF).

Example II

[0155] In analogous fashion proteins constructs as depicted in figure 2 may be expressed utilising the corresponding DNA sequences shown therein. In particular, yeast strain SC333 (construct 2) corresponds to Y1796 strain but expressing P501₁₅₅₋₅₅₃ devoid of the CPC fusion partner. Yeast strain Y1800 (construct 3) corresponds to Y1796 strain but additionally comprises the native sequence signal for P501 S (aa1-aa34), while yeast strain Y1802 (construct 4) comprises the alpha pre signal sequence upstream CPC-P501S sequence. Yeast strain Y1790 (construct 5) is expressing a P501S construct devoid of CPC and having the alpha prepro signal sequence.

Example III. Preparation of purified CPC-P501

1. - Production of CPC-P501S HIS (Y1796) at small scale

[0156] For Y1796, in minimal medium supplemented with histidine, expression is induced in log phase by addition of CuSO₄ ranging from 100 to 500 μ M, and culture is maintained at 30°. Cells are harvested after 8 or 24H induction. Copper is added just before use and not mixed with medium in advance.

[0157] For SDS PAGE analysis, yeast cells extraction is performed in citrate phosphate buffer pH4.0 + 130 mM NaCl. Extraction is performed with glass beads for small cell quantity and with French press for higher cells quantity, and then mixed with sample buffer and SDS-PAGE analysed. Results of comparative analysis on SDS PAGE of the different constructs are depicted in figure 8 and summarised in Table 2 below.

As shown in Table 1 below, the level of expression of the culture is much higher for Y1796 strain as compared to the expression level of parent strain SC333, a strain expressing the corresponding P501S-His devoid of CPC partner. Likewise, the presence of a signal sequence (alpha pre) does not affect the results discussed above: the level of

expression of the culture is much higher for Y1802 strain as compared to the expression level of corresponding strain Y1790, a strain expressing the corresponding P501S-His devoid of CPC partner.

Table 2

Recombinant Strain	Plasmid	Promotor	Signal sequence	Fusion Partner	P501 aa sequences	Expression level
SC333	Ma333	CUP1	-	-	55-553-His	ND
Y1796	pRIT 15201	CUP 1	-	CPC	51-553- His	+++
Y1802	pRIT 15219	CUP 1	α pre	CPC	51-553- His	++++
Y1790	pRIT 15068	CUP 1	α prepro	-	55-553- His	+

CPC = clyta P2 clyta
 ND= not detectable, even in western blot
 + = detectable in western blot
 +++ / ++++ = detectable in western blot and visible in silver stained gels

2. - Fermentation of Y1796 (RIX4440) at larger scale

[0158] 100 μ l of the working seed are spread on solid medium and grown for approximately 24h at 30°C. This solid pre-culture is then used to inoculate a liquid pre-culture in shake flasks.

[0159] This liquid pre-culture is grown for 20h at 30°C and transferred into a 20L fermenter. The fed-batch fermentation includes a growth phase of about 44h and an induction phase of about 22h.

[0160] The carbon source (glucose) was supplemented to the culture by a continuous feeding. The residual glucose concentration was maintained very low (≤ 50 mg/L) in order to minimise the ethanol production by fermentation. This was realised by limiting the development of the micro-organism by limited glucose feed rate.

At the end of the growth phase, CUP1 promoter is induced by adding CuSO_4 in order to produce the antigen.

[0161] The absence of contaminations was checked by inoculating 10^8 cells into standard TSB and THI vials supplemented with nystatine and incubated respectively for 14 days at 20-25°C and at 30-35°C. No growth was observed as expected.

3. - Antigen characterisation and productivity

[0162] Cell homogenates were prepared by French pressing of fermentation samples harvested at different times during the induction phase and analysed by SDS-PAGE and Western Blot. It was shown that the major part of the protein of interest was located in the insoluble fraction obtained from the cell homogenate after centrifugation. The SDS-PAGE and Western Blot analyses shown in the Figures below were realised on the pellets obtained after centrifugation of these cell homogenates.

[0163] Figures 8 A and B show a kinetics of the antigen production during the induction phase for culture PR0127. It appears that no antigen expression occurred during the growth phase. The specific antigen productivity seems to increase from the beginning of the induction phase up to 6h and then remained quite stable up to the end. But the volumetric productivity increased by a factor 1.5 to 2 due to biomass accumulation observed during the same period of time. The antigen productivity was estimated at about 500 mg per litre of fermentation broth by comparing purified reference of the antigen and crude extracts on SDS-PAGE with silver staining (figure 9A) and WB analyses using an anti-P501 S antibody (a murine ascite directed against P501S aa439-aa459 used at a dilution of 1/1000) (figure 9B).

Example IV. Purification of CPC-P501 (51-553)-His fusion protein produced by Y1796

[0164] After the cell breakage, the protein is associated with the pellet fraction. A carbamido-methylation of the molecule has been introduced in the process in order to cope with the oxidative aggregation of the molecule with itself or with host cell protein contaminants through covalent bridging with disulphide bonds. The use of detergents has also been required to manage the hydrophobic character of this protein (12 trans-membrane domains predicted).

[0165] The purification protocol, developed for the scale of 1 L of culture OD (optical density) 120, is described in figure 10. All the operations are performed at room temperature (RT)

According to DOC TCA BCA protein assay, the global purification yield is 30 - 70 mg of purified antigen / L of culture OD 120. The yield is linked to the level of expression of the culture and is higher as compared to the purification yield

of parent strain expressing unfused P501 S-His.

The protein assay is performed as follows: proteins are first precipitated using TCA (trichloroacetic acid) in the presence of DOC (deoxycholate) then dissolved in an alkaline medium in the presence of SDS. The proteins then react with BCA (bicinchoninic acid) (Pierce) to form a soluble purple complex presenting a high adsorbance at 562 nm, which is proportional to the amount of proteins present in the sample.

SDS-PAGE analysis of 3 purified bulks (figure 11) shows no difference in reducing and non reducing conditions (cf. lanes 2, 3 and 4 versus lanes 5, 6 and 7). The pattern consists of a major band at 70 kDa, a smear of higher MW and faint degradation bands. All the bands are detected by a specific anti P501 S monoclonal antibody.

Example V. Vaccine preparation using CPC- P501S His protein

[0166] The protein of Example 3 or 4 can be formulated into a vaccine containing QS21 and 3D-MPL in an oil in water emulsion.

1. - Vaccine preparation:

[0167] The antigen produced as shown in Example 1 to 3 a C-LyTA - P2 - P501 S His. As an adjuvant, the formulation comprises a mixture of 3 de -O-acylated monophosphoryl lipid A (3D-MPL) and QS21 in an oil/water emulsion. The adjuvant system SBAS2 has been previously described WO 95/17210.

[0168] 3D-MPL: is an immunostimulant derived from the lipopolysaccharide (LPS) of the Gram-negative bacterium *Salmonella minnesota*. MPL has been deacylated and is lacking a phosphate group on the lipid A moiety. This chemical treatment dramatically reduces toxicity while preserving the immunostimulant properties (Ribi, 1986). Ribi Immunochemistry produces and supplies MPL to SB-Biologics.

Experiments performed at Smith Kline Beecham Biologicals have shown that

3D-MPL combined with various vehicles strongly enhances both the humoral and a TH1 type of cellular immunity.

[0169] QS21: is a natural saponin molecule extracted from the bark of the South American tree *Quillaja saponaria* Molina. A purification technique developed to separate the individual saponins from the crude extracts of the bark, permitted the isolation of the particular saponin, QS21, which is a triterpene glycoside demonstrating stronger adjuvant activity and lower toxicity as compared with the parent component. QS21 has been shown to activate MHC class I restricted CTLs to several subunit Ags, as well as to stimulate Ag specific lymphocytic proliferation (Kensil, 1992). Aquila (formerly Cambridge Biotech Corporation) produces and supplies QS21 to SB-Biologics.

Experiments performed at SmithKline Beecham Biologicals have demonstrated a clear synergistic effect of combinations of MPL and QS21 in the induction of both humoral and TH1 type cellular immune responses.

[0170] The oil/water emulsion is composed an organic phase made of 2 oils (a tocopherol and squalene), and an aqueous phase of PBS containing Tween 80 as emulsifier. The emulsion comprised 5% squalene 5% tocopherol 0.4% Tween 80 and had an average particle size of 180 nm and is known as SB62 (see WO 95/17210).

Experiments performed at SmithKline Beecham Biologicals have proven that the adjunction of this O/W emulsion to 3D-MPL/QS21 (SBAS2) further increases the immunostimulant properties of the latter against various subunit antigens.

2. - Preparation of emulsion SB62 (2 fold concentrate):

[0171] Tween 80 is dissolved in phosphate buffered saline (PBS) to give a 2% solution in the PBS. To provide 100 ml two fold concentrate emulsion 5g of DL alpha tocopherol and 5ml of squalene are vortexed to mix thoroughly. 90ml of PBS/Tween solution is added and mixed thoroughly. The resulting emulsion is then passed through a syringe and finally microfluidised by using an M110S microfluidics machine. The resulting oil droplets have a size of approximately 180 nm.

3. - Formulations:

[0172] A typical formulation containing 3D-MPL and QS21 in an oil/water emulsion is performed as follows: 20 µg - 25 µg C-LyTA P2-P501S are diluted in 10 fold concentrated of PBS pH 6.8 and H₂O before consecutive addition of SB62 (50 µl), MPL (20 µg), QS21 (20 µg), optionally comprising CpG oligonucleotide (100 µg) and 1 µg/ml thiomersal as preservative. The amount of each component may vary as necessary. All incubations are carried out at room temperature with agitation.

Example VI. Codon-optimised P501S sequences**1. - Generation of the control recombinant plasmids:**

[0173] Full-length P501S sequence was cloned into pVAC (Thomsen, Immunology, 1998; 95:510P105), generating expression plasmid JNW680. SEQ ID NO:17 represents human P501S expression cassette in the plasmid JNW680 and is illustrated in Figure 12. The protein sequence of SEQ ID NO:17 is shown in single letter format, the start and stop codons being shown in bold. The Kozak sequence is denoted by the hash symbols. The codon usage index of the human P501 S sequence (SEQ ID NO:17) is 0.618, as calculated by the SynGene programme.

SynGene programme

[0174] Basically, the codons are assigned using a statistical method to give synthetic gene having a codon frequency closer to that found naturally in highly expressed *E. coli* and human genes.

[0175] SynGene is an updated version of the Visual Basic program called CalcGene, written by R. S. Hale and G. Thompson (Protein Expression and Purification Vol. 12 pp.185-188 (1998)). For each amino acid residue in the original sequence, a codon was assigned based on the probability of it appearing in highly expressed *E. coli* genes. Details of the CalcGene program, which works under Microsoft Windows 3.1, can be obtained from the authors. Because the program applies a statistical method to assign codons to the synthetic gene, not all resulting codons are the most frequently used in the target organism. Rather, the proportion of frequently and infrequently used codons of the target organism is reflected in the synthetic sequence by assigning codons in the correct proportions. However, as there is no hard-and-fast rule assigning a particular codon to a particular position in the sequence, each time it is run the program will produce a different synthetic gene - although each will have the same codon usage pattern and each will encode the same amino acid sequence. If the program is run several times for a given amino acid sequence and a given target organism, several different nucleotide sequences will be produced which may differ in the number, type and position of restriction sites, intron splice signals etc., some of which may be undesirable. The skilled artisan will be able to select an appropriate sequence for use in expression of the polypeptide on the basis of these features.

[0176] Furthermore, since the codons are randomly assigned on a statistical basis, it is possible (although perhaps unlikely) that two or more codons which are relatively rarely used in the target organism might be clustered in close proximity. It is believed that such clusters may upset the machinery of translation and result in particularly low expression rates, so the algorithm for choosing the codons in the optimized gene excludes any codons with an RSCU value of less than 0.2 for highly expressed genes in order to prevent any rare codon clusters being fortuitously selected. The distribution of the remaining codons is then allocated according to the frequencies for highly expressed *E. coli* to give an overall distribution within the synthetic gene that is typical such genes (coefficient = 0.85) and also for highly expressed human genes (coefficient = 0.50).

SynGene (Peter Ertl, unpublished), an updated version of the CalcGene program, allows exclusion of rare codons to be optional, and is also used to allocate codons according to the codon frequency pattern of highly expressed human genes.

[0177] The sequence of the CPC-P501 S cassette cloned from the vector pRIT15201 (see Figure 7) into pVAC, thereby generating plasmid JNW735, is set forth in SEQ ID NO:18 and is illustrated in Figure 13. This sequence is identical to the pRIT15201 sequence with the exception of the removal of the His tag and the addition of a Kozak sequence (GCCACC) and appropriate restriction enzyme sites. The amino acid sequence of SEQ ID NO:18 is shown in single letter format, the start and stop codons are shown in bold. The boxed residues are the P2 helper epitope of tetanus toxoid. The underlined residues are the Clyta purification tag. The Kozak sequence is denoted by the hash symbols.

2. - Generation of the recombinant plasmids with P501S codon optimised sequences:

[0178] Although the codon coefficient index (CI) of P501S native sequence is already high (0.618), it is possible increase the CI value further. This will have two potential benefits - to improve the antigen expression and/or immunogenicity and to reduce the possibility for recombination between the P501 S vector and genomic sequences.

[0179] Using the SynGene programme, a selection (SEQ ID NO:19 to SEQ ID NO:20) of codon optimised sequences was obtained (Figure 14). Table 3 below shows a comparison of the codon coefficient index for the starting P501 S sequence and the two representative codon optimised sequences, selected on the basis of a suitable restriction enzyme site profile and a good CI index.

Table 3 - Comparison of the codon coefficient indices of two codon optimised P501 S genes

Sequence	Codon coefficient index (CI)
P501 S	0.618

(continued)

Sequence	Codon coefficient index (CI)
SEQ ID NO:19	0.725
SEQ ID NO:20	0.755

3. Further evaluation of the codon-optimised sequences

Sequence SEQ ID NO:19

[0180] Although SEQ ID NO: 19 has a good CI index (0.725), it contains a doublet of rare codons at amino acids position 202 and 203. These codons were manually substituted with more frequent codons by changing the DNA sequence from TTGTTG to CTGCTG. To facilitate cloning and expression, restriction enzyme sites and a Kozak sequence were added. The final engineered sequence (SEQ ID NO:21) is shown in Figure 15. The Syngene programme was used to fragment this sequence into oligonucleotides with a minimum overlap of 19-20 bases. Therefore, Figure 15 shows the re-engineered P501S codon optimised SEQ ID NO. 19. Restriction enzyme sites are underlined, Kozak sequence is bolded, re-engineered DNA sequence to remove a rare codon doublet is boxed.

[0181] Using a two-step PCR protocol, the overlapping primers generated by the Syngene programme were first assembled using a PCR Assembly protocol (detailed below). The assembly reaction generates a diverse population of fragments. The correct full-length fragment was recovered/amplified using the PCR recovery protocol and the terminal primers. The resulting PCR fragment was excised from an agarose gel, purified, restricted with NheI and XhoI and cloned into pVAC. Positive clones were identified by restriction enzyme analysis and confirmed by double-stranded sequencing. This generates plasmid JNW766, which, due to the error-prone nature of the PCR process, contained a single silent mutation (C to T at position 360 of SEQ ID NO: 21).

1. Assembly reaction - PCR conditions, generic protocol

[0182] Reaction mix (total volume = 50µl):

- 1 x Reaction buffer (Pfx or Proofstart)
- 1µl Oligo pool (equal mix of all overlapping oligos)
- 0.5mM dNTPs
- DNA polymerase (Pfx or Proofstart, 2.5-5U)
- +/-1mM MgSO₄
- +/-1x enhancer solution (Pfx enhancer or Proofstart buffer Q)

1. 94°C for 120s (Proofstart only)
2. 94°C for 30s
3. 40°C for 120s
4. 72°C for 10s
5. 94°C for 15s
6. 40°C for 30s
7. 72°C for 20s + 3s/cycle
8. Cycle to step 5, 25 times
9. Hold at 4°C

2. Recovery reaction - PCR conditions (generic protocol)

[0183] Reaction mix (total volume = 50µl):

- 1 x Reaction buffer (Pfx or Proofstart)
- 5-10µl assembly reaction mix
- 0.3-0.75mM dNTPs
- 50pmol primer (5' terminal primer, sense orientation)
- 50pmol primer (3' terminal primer, anti-sense orientation)
- DNA polymerase (Pfx or Proofstart, 2.5-5U)
- +/-1 mM MgSO₄

- +/-1x enhancer solution (Pfx enhancer or Proofstart buffer Q)

1. 94°C 120s (Proofstart only)
2. 94°C 45s
- 5 3. 60°C 30s
4. 72°C 120s
- 5 Cycle to step 2, 25 times
6. 72°C 240s
7. Hold at 4°C

Sequence SEQ ID NO:20

[0184] Although SEQ ID NO: 20 has a very good CI index (0.755), it was noticed that it contained a doublet of rare codons at amino acids position 131 and 132. These codons were manually substituted with more frequent codons by changing the DNA sequence from TTGTTG to CTGCTG. To facilitate cloning, an internal BamHI site was removed by mutating G to C (see the double-underlined nucleotide in Figure 16). To facilitate cloning and expression, restriction enzyme sites and a Kozak sequence were added. The final engineered sequence (SEQ ID NO:22) is shown in Figure 16. The Syngene programme was used to fragment this sequence into oligonucleotides with a minimum overlap of 19-20 bases.

Figure 16 therefore shows the re-engineered P501S codon optimised sequence 20 (SEQ ID NO:22). Restriction enzyme sites are underlined, Kozak sequence is bolded, re-engineered DNA sequence to remove a rare codon doublet is boxed and a silent point mutation to remove a BamHI site is double-underlined.

[0185] Using a similar two-step PCR protocol to the one described above, full-length P501S fragment was amplified and cloned into pVAC. Positive clones were identified by restriction enzyme analysis and confirmed by double-stranded sequencing. This generates plasmid JNW764. The sequence of the P501S coding cassette is shown in Figure 16 (SEQ ID NO: 22).

DNA Sequence similarity

[0186] Pair distances following alignment by the ClustalV (weighted) method are shown in Table 3 below. Table 4 below shows percent similarity between the starting human P501S sequence and the two codon optimised sequences SEQ ID NO:21 and 22 selected for further investigation. The data confirms that the codon optimised DNA sequences are approximately 80% similar to the original P501 S sequence.

Table 4

Example VII. Codon-optimised CPC sequences

1.- Approach

[0187] Since the original CPC sequence was originally designed for optimal expression in yeast, this section describes the process of codon optimisation for human expression.

2.- Sequence design

[0188] The starting sequence for the optimisation of CPC is shown in Figure 17 (SEQ ID NO: 23). This is derived entirely from the pRIT15201 and contains the entire coding sequence of CPC plus four amino acids of P501S to facilitate downstream cloning. Using the Syngene programme, a selection of codon optimised sequences were obtained, from which representative sequences are shown in Figure 18 (SEQ ID NO: 24-25). Table 5 below shows a comparison of the codon coefficient index for the starting CPC sequence and the two representative codon optimised sequences.

Table 5. Codon coefficient indices for two CPC optimised sequences

Sequence	Codon coefficient index (CI)
Original CPC = SEQ ID NO:23	0.506
SEQ ID NO:24	0.809
SEQ ID NO:25	0.800

[0189] In addition to the codon optimisation, all sequences were also screened for restriction enzyme cloning sites. On the basis of the highest CI value and a favourable restriction enzyme site profile, SEQ ID NO. 24 was selected for construction. To facilitate cloning and expression, 5' and 3' cloning sites were added and a Kozak sequence (GCCACC) was inserted 5' of the initiating ATG start codon. This engineered sequence is shown in Figure 19 (SEQ ID NO:26). This sequence includes four amino acids of P501 S (boxed), restriction enzyme cloning sites (NheI and XhoI, underlined), a Kozak sequence (Bold), a stop codon (italicised) and 4bp of flanking irrelevant DNA to facilitate cloning.

[0190] The Syngene programme was used to fragment this sequence into 50-60-mer oligonucleotides with a minimum overlap of 18-20 bases.

Using a similar two-step PCR protocol to the one described above, the correct fragment was recovered/amplified and cloned into pVAC. Positive clones were identified by restriction enzyme analysis and sequence verified generating vector JNW759.

4.- DNA similarity

[0191] Pair Distances following alignment ClustalV (Weighted) are shown in Table 6 below. The table shows percent similarity at the DNA level between the starting sequence of CPC and the codon optimised sequence and confirms that the codon optimised sequences are approximately 80% similar to the original CPC sequence.

Table 6

Sequence SEQ ID NO:	% similarity with starting CPC sequence
24	80.2
25	81.6

Example VIII. Construction of the P501S fusion candidate

[0192] All the candidates shown in the schematic below are codon optimised and constructed using overlapping PCR methodologies from plasmids JNW764 and JNW759 as templates (SEQ ID NO: 22 and SEQ ID NO: 26 respectively), and cloned into the expression vector p7313 ie.

[0193] The four candidates shown schematically below are based upon CPC-P501S. Codon optimised CPC-P501S is construct A. Candidates B, C, D also include the sequence encoding the N terminal 50 amino acids of P501S, positioned either at the N terminus of CPC-P501S (construct D), the C terminus of CPC-P501S (construct C), or between CPC and P501S (construct B). A schematic representation of the constructs is given in Figure 20.

The nucleotide and protein sequence for each of the four constructs is shown in SEQ ID NO: 37-40 for the nucleotide sequences, and SEQ ID NO. 45-48 for the corresponding polypeptide sequences. In constructs A, C and D, the underlined codon preferentially encodes tyrosine (either TAC or TAT) but the nucleotide sequence may be altered to encode threonine (either ACA, ACC, ACG or ACT). In construct B, the underlined codon preferentially encodes threonine (either ACA, ACC, ACG or ACT), but the nucleotide sequence may be altered to encode tyrosine (either TAC or TAT). In all constructs, the coding sequence is flanked by appropriate restriction enzyme cloning sites (in this case, NotI and BamHI), and a Kozak sequence immediately upstream of the initiating ATG. Table 7 below shows the plasmid identification for the constructs detailed above:

Table 7

Construct	Amino acid at underlined codon	Sequence of codon	Plasmid ID
A	Tyrosine	TAC	JNW771
B	Threonine	ACA	JNW773
B	Tyrosine	TAC	JNW770

(continued)

Construct	Amino acid at underlined codon	Sequence of codon	Plasmid ID
C	Tyrosine	TAC	JNW777
D	Tyrosine	TAC	JNW769

[0194] The cellular responses following immunisation with p7313-ie (empty vector), pVAC-P501 S (JNW735), JNW770, JNW771 and JNW773 were assessed by ELISPOT following a primary immunisation by PMID at day 0 and three boosts at day 21, 42 and 70. Assays were carried out 7 days post boost. Figure 27 shows that good IL-2 ELISPOT responses were detected in mice immunised with JNW770, JNW771 and JNW773.

Example IX. Immunogenicity experiments using particle-mediated intra-dermal delivery (PMID) studies

[0195] Full-length P501 S, when delivered by particle mediated intra-dermal delivery (PMID), generates good antibody & cellular responses. These data demonstrate that the PMID is a very effective delivery route. Furthermore, comparison of P501 S and CPC-P501 S confirms that CPC-P501S induces a stronger immune response as determined by peptide ELISPOT.

1.- Materials & Methods

1.1. Cutaneous gene gun immunisation

[0196] Plasmid DNA was precipitated onto 2µm diameter gold beads using calcium chloride and spermidine. Loaded beads were coated onto Tefzel tubing as described (Eisenbraun et al, 1993; Pertmer et al, 1996). Particle bombardment was performed using the Accell gene delivery system (PCT WO 95/19799). For each plasmid, female C57BU6 mice were immunised on days 0, 21, 42 and 70. Each administration consisted of two bombardments with DNA/gold, providing a total dose of approximately 4-5 µg of plasmid.

1.2. ELISPOT assays for T cell responses to the P501S gene product

a) Preparation of splenocytes

[0197] Spleens were obtained from immunised animals at 7-14 days post boost. Spleens were processed by grinding between glass slides to produce a cell suspension. Red blood cells were lysed by ammonium chloride treatment and debris was removed to leave a fine suspension of splenocytes. Cells were resuspended at a concentration of 8×10^6 /ml in RPMI complete media for use in ELISPOT assays.

b) Screening of peptide library

[0198] A peptide library covering a majority of the P501 S sequence was obtained from Corixa Corp. The library contained fifty 15-20mer peptides overlapping by 4-11 amino acids peptides. The peptides are numbered 1-50. In addition, a prediction programme (H-G. Rammensee, et al.: Immunogenetics, 1999, 50: 213-219) (<http://syfpeithi.bmi-heidelberg.com/>) was used to predict putative Kb and Db epitopes from the P501 S sequence. The ten best epitopes for Kb and Db were ordered from Mimotopes (UK) and included in the library (peptides 51-70). For screening of the peptide library, peptides were used at a final concentration of 50µg/ml (approx. 25-50µM) in IFNγ and IL-2 ELISPOTS using the protocol described below. For IFNγ ELISPOTS, IL-2 was added to the assays at 10ng/ml. Splenocytes used for the screening were taken at day 84 from C57BU6 mice immunised at day 0, 21, 42 and 70. Three peptides were identified from the library screen - Peptides 18 (HCRQAYSVYAFMISLGGCLG), 22 (GLSAPSLSPHCPCRARLAF) and 48 (VCLAAGITYVPPLLEVG). These peptides were subsequently used in the ELISPOT assays

c) ELISPOT assay

[0199] Plates were coated with 15µg/ml (in PBS) rat anti mouse IFNγ or rat anti mouse IL-2 (Pharmingen). Plates were coated overnight at +4°C. Before use the plates were washed three times with PBS. Splenocytes were added to the plates at 4×10^5 cells/well. Peptides identified in the library screen were re-ordered from Genemed Synthesis and used at a final concentration of 50µg/ml. CPC-P501S protein (GSKBio) was used in the assay at 20µg/ml. ELISPOT assays were carried out in the presence of either IL-2 (10ng/ml), IL-7 (10ng/ml) or no cytokine. Total volume in each

well was 200 μ l. Plates containing peptide stimulated cells were incubated for 16 hours in a humidified 37°C incubator.

e) Development of ELISPOT assay plates.

[0200] Cells were removed from the plates by washing once with water (with 10 minute soak to ensure lysis of cells) and three times with PBS. Biotin conjugated rat anti mouse IFN γ or IL-2 (Pharmingen) was added at 1 μ g/ml in PBS. Plates were incubated with shaking for 2 hours at room temperature. Plates were then washed three times with PBS before addition of Streptavidin alkaline phosphatase (Caltag) at 1/1000 dilution. Following three washes in PBS spots were revealed by incubation with BCIP substrate (Biorad) for 15-45 mins. Substrate was washed off using water and plates were allowed to dry. Spots were enumerated using an image analysis system devised by Brian Hayes, Asthma Cell Biology unit, GSK.

1.3. ELISA assay for antibodies to the P501 S gene product

[0201] Serum samples were obtained from the animals by venepuncture on days -1, 28, 49 and 56, and assayed for the presence of anti-P501S antibodies. ELISA was performed using Nunc Maxisorp plates coated overnight at 4°C with 0.5 μ g/ml of CPC-P501S protein (GSKBio) in sodium bicarbonate buffer. After washing with TBS-Tween (Tris-buffered saline, pH 7.4 containing 0.05 % of Tween 20) the plates were blocked with Blocking buffer (3% BSA in TBS-Tween buffer) for 2hrs at room temperature. All sera were incubated at 1:100 dilution for 1 hr at RT in Blocking buffer. Antibody binding was detected using HRP-conjugated rabbit anti-mouse immunoglobulins (#P0260, Dako) at 1:2000 dilution in Blocking buffer. Plates were washed again and bound conjugate detected using Fast OPD colour reagents (Sigma, UK). The reaction was stopped by the addition of 3M sulphuric acid, and the OPD product quantitated by measuring the absorbance at 490nm.

1.4. Transient transfection assays

[0202] Human P501 S expression from various DNA constructs was analysed by transient transfection of the plasmids into CHO (Chinese hamster ovary) cells followed by Western blotting on total cell protein. Transient transfections were performed with the Transfectam reagent (Promega) according to the manufacturer's guidelines. In brief, 24-well tissue culture plates were seeded with 5x10⁴ CHO cells per well in 1 ml DMEM complete medium (DMEM, 10% FCS, 2mM L-glutamine, penicillin 100IU/ml, streptomycin 100 μ g/ml) and incubated for 16 hours at 37°C. 0.5 μ g DNA was added to 25 μ l of 0.3M NaCl (sufficient for one well) and 2 μ l of Transfectam was added to 25 μ l of Milli-Q. The DNA and Transfectam solutions were mixed gently and incubated at room temperature for 15 minutes. During this incubation step, the cells were washed once in PBS and covered with 150 μ l of serum free medium (DMEM, 2mM L-glutamine). The DNA-Transfectam solution was added drop wise to the cells, the plate gently shaken and incubated at 37°C for 4-6 hours. 500 μ l of DMEM complete medium was added and the cells incubated for a further 48-72 hours at 37°C.

2. Western blot analysis of CHO cells transiently transfected with P501S plasmids

[0203] The transiently transfected CHO cells were washed with PBS and treated with a Versene (1:5000)/0.025% trypsin solution to transfer the cells into suspension. Following trypsinisation, the CHO cells were pelleted and resuspended in 50 μ l of PBS. An equal volume of 2x NP40 lysis buffer was added and the cells incubated on ice for 30 minutes. 100 μ l of 2x TRIS-Glycine SDS sample buffer (Invitrogen) containing 50mM DTT was added and the solution heated to 95°C for 5 minutes. 1-20 μ l of sample was loaded onto a 4-20% TRIS-Glycine Gel 1.5mm (Invitrogen) and electrophoresed at constant voltage (125V) for 90 minutes in 1x TRIS-Glycine buffer (Invitrogen). A pre-stained broad range marker (New England Biolabs, #P7708S) was used to size the samples. Following electrophoresis, the samples were transferred to Immobilon-P PVDF membrane (Millipore), pre-wetted in methanol, using an Xcell III Biot Module (Invitrogen). 1x Transfer buffer (Invitrogen) containing 20% methanol and a constant voltage of 25V for 90 minutes. The membrane was blocked overnight at 4°C in TBS-Tween (Tris-buffered saline, pH 7.4 containing 0.05 % of Tween 20) containing 3% dried skimmed milk (Marvel). The primary antibody (10E3) was diluted 1:1000 and incubated with the membrane for 1 hour at room temperature. Following extensive washing in TBS-Tween, the secondary antibody (HRP-conjugated rabbit anti-mouse immunoglobulins (#P0260, Dako)) was diluted 1:2000 in TBS-Tween containing 3% dried skimmed milk and incubated with the membrane for one hour at room temperature. Following extensive washing, the membrane was incubated with Supersignal West Pico Chemiluminescent substrate (Pierce) for 5 minutes. Excess liquid was removed and the membrane sealed between two sheets of cling film, and exposed to Hyperfilm ECL film (Amersham-PharmaciaBiotech) for 1-30 minutes.

3. Generation of the Full-length human P501S expression cassette

[0204] The starting point for the construction of a P501S expression cassette was the plasmid pcDNA3.1-P501 S (Corixa Corp), which has a pcDNA3.1 backbone (Invitrogen) containing a full-length human P501 S cDNA cassette cloned between the EcoRI and NotI sites. This vector is also termed JNW673. The presence of P501S was confirmed by fluorescent sequencing. The sequence of the cDNA cassette is given by the NCBI/Genbank sequence (accession number AY033593). Human P501 S was PCR amplified from JNW673 template DNA, restricted with XbaI and SalI and cloned into the NheI/XhoI sites of pVAC generating vector JNW680. The correct orientation of the fragment relative to the CMV promoter was confirmed by PCR and by DNA sequencing. The sequence of the expression cassette is shown in Figure 12 (SEQ ID NO: 17).

To construct a CPC-P501 S expression cassette, CPC-P501 S was PCR amplified from the vector pRIT15201 (see Figure 7), restricted with XbaI and SalI and cloned into the NheI and XhoI sites of pVAC, generating plasmid JNW735. The correct orientation was confirmed by PCR and sequencing. The sequence of the CPC-P501 S expression cassette is shown in Figure 13 (SEQ ID NO: 18).

4. Expression of human P501S from plasmids JNW680 and JNW735

[0205] The P501S expression plasmids were transiently transfected into CHO cells and a total cell lysate prepared as described in methods. A Western blot of a total cell lysate identified single bands of approximately 55kDa and 62kDa for samples transfected with JNW680 and JNW735 respectively (Figure 21). This is consistent with the predicted molecular weights of 59.3kDa and 63.3kDa for P501 S and CPC-P501 S respectively. The addition of the CPC tag does not adversely affect the expression of P501 S.

5. Results

5.1. Antibody responses to human P501S following PMID immunisation

[0206] The antibody responses following immunisation with pVAC (empty vector) and pVAC-P501S (JNW680) were assessed by ELISA following a primary immunisation by PMID at day 0 and three boosts at day 21 and day 42 and day 70. Figure 22 shows the antibody responses from sera taken at day -1, day 28 and day 49 (mice A1-3, B1-3) and day 56 (mice A4-6, B4-9). Whilst there were some non-specific responses to the pVAC empty vector, specific responses to the P501 S construct were seen in 5 of 9 mice.

5.2. Identification of novel T cell epitopes from human P501S in C57BU6 mice by screening of a P501S peptide library

[0207] Following immunisation with JNW680 (pVAC-P501S) by PMID at day 0 and three boosts at day 21 and day 42 and day 70, ELISPOT assays were carried out at day 84. Peptides from the P501 S library were tested at 50µg/ml final concentration. From this initial screen, three peptides were found to stimulate IFN γ and/or IL-2 secretion. Peptides 18, 22 and 48 (Figure 23). These peptides were used in subsequent cellular assays.

5.3. Cellular responses to pVAC-P501S (JNW680) following PMID immunisation

[0208] The cellular responses following immunisation with pVAC (empty vector) and pVAC-P501 S were assessed by ELISPOT following a primary immunisation by PMID at day 0 and three boosts at day 21, 42 and 70. Assays were carried out 7 days post boost. Two different assay conditions were used: 1) Peptides 18, 22 and 48 identified in the peptide library screen used at 50µg/ml final concentration and 2) CPC-P501S protein used at 20µg/ml final concentration. Figure 24A shows that whilst there were no P501 S-specific responses to the empty vector (A4-6), the pVAC-P501 S construct induced specific IFN- γ responses to Peptides 18 and 22 in all mice (B6-9) whilst one mouse (B7) also showed an IFN- γ response to Peptide 48. Figure 24B shows that all mice showed specific IL-2 responses to Peptides 18, 22 and 48. Furthermore, pVAC-P501 S immunised mice (B6-9) also showed moderate IL-2 responses to CPC-P501S, whereas the empty vector immunised mice (A4-6) showed no responses.

5.4. Comparison of cellular responses to P501S and CPC-P501S following PMID immunisation.

[0209] The cellular responses following immunisation with pVAC (empty vector), pVAC-P501S (JNW680) and CPC-P501S (JNW735) were assessed by ELISPOT following a primary immunisation by PMID at day 0 and boosts at day 21 and 42. Assays were carried out 7 days post boost. Two different assay conditions were used: 1) Peptides 18, 22

and 48 identified in the peptide library screen used at 50 µg/ml final concentration and 2) CPC-P501 S protein used at 20 µg/ml final concentration. Figure 25 shows that at day 28, CPC-P501 S induced good IL-2 responses to 10 µg/ml of peptide 22, whilst there were no P501 S-specific responses to either the empty vector or the pVAC-P501 S. These results were also seen using CPC-P501 S protein to re-stimulated the splenocytes. At day 49 (post 2nd boost), the responses induced by P501 S and CPC-P501 S were equivalent. These data suggest that the addition of the CPC tag improves the kinetics and/or magnitude of the response to P501 S.

Example IX. Immunogenicity experiments in mice using P501S Protein + adjuvant studies

1. Design and adjuvant formulation

[0210] The immune response induced by vaccination using the recombinant purified CPC-P501 S protein formulated in adjuvants is characterized in experiments performed in mice.

Groups of 5 to 10, eight weeks old female C57BL/6 mice are vaccinated, 2-6 times intramuscularly at 2 weeks intervals with 10 µg of the CPC-P501S protein formulated in different adjuvant systems. The volume administered corresponds to 1/10th of a human dose (50 µl).

The serology (total Ig response) and cellular response (T cell lymphoproliferation and cytokine production) are analyzed on spleen cells, 6-14 days after the last vaccination using standard protocols as described in Gérard, c. et al., 2001, Vaccine 19, 2583-2589.

[0211] The data of one representative experiment is shown. It included 5 groups of eight C57BL/6 female mice which received 4 intramuscular injections of CPC P501 (10 µg) + adjuvant (A, B, C) at days 0, 14, 28, 42. Example V provides an experimental protocol of how to carry out the formulations. Briefly the adjuvant formulations are as follows (quantities given for one dose of 100 µl):

- **Adjuvant A:** QS21 (10 µg), MPL (10 µg) and CpG7909 (100 µg) made according to the method disclosed in WO 00/62800;
- **Adjuvant B:** formulation of QS21 (20 µg), MPL (20 µg), CpG7909 (100 µg) and 50 µl SB62 oil-in-water emulsion (WO 95/17210);
- **Adjuvant C:** formulation of QS21 (10 µg), MPL (10 µg), CpG7909 (100 µg) and 10 µl SB62 oil-in-water emulsion (WO 99/12565).

2. Serology

[0212] The total Ig response induced by vaccination was measured by ELISA using either the CPC-P501 or RA12 -P501 (C term, which is a truncated form of the P501 protein corresponding to the C terminus of the protein fused at its N terminus, to a TB derived protein RA12 - Ra12 is derived from MTB32A antigen described in Skelky et al., Infection and Immunity, (1999) 67:3998-4007).

The adjuvanted CPC-P501 S proteins give a good antibody response after vaccination.

3. Cellular response

3.1. Lymphoproliferation

[0213] 7 days after the latest vaccine, lymphoproliferation was performed on spleen cells individually. 2.10e5 spleen cells were plated in quadruplicate, in 96 well microplate, in RPMi medium containing 1% normal mice serum. After 72 hours of re-stimulation with either the immunogen (CPC-P501) or the truncated protein (RA12 P501) at different concentration, 1 µCi 3H thymidine (Amersham 5Ci/ml) was added. After 16 hours, cells were harvested onto filter plates. Incorporated radioactivity was counted in a β counter. Results are expressed in CPM or as stimulation indexes* (geomean CPM in cultures with antigen / geomean CPM in cultures without antigen).

Re-stimulation with ConA (2 µg/ml) as positive control was included as positive control.

[0214] As shown in Figure 26, a P501 specific lymphoproliferation is seen in the spleen of all groups of mice receiving the adjuvanted protein after in vitro re-stimulation with either the immunogen or another P501 protein made in another expression system (*E coli*), indicating that T cells have been primed in vivo by the vaccination.

3.2. IFNγ production measured by intracellular staining of spleen cells

[0215] Bone Marrow Dendritic Cells (BMDC) obtained after culture of mouse PBL for 7 days in the presence of GM-CSF.. 7 days after the latest vaccine, spleen or PBL are collected and a cell suspension prepared. 10e6 cells (1 pool per group)

were incubated +/-18hrs with 10e5 BMDC pulsed overnight with 10µg/ml of either the CPCp501 protein or the RA12. After a treatment with the 2.4.G.2 antibody, spleen cells were stained with fluorescent anti CD4 and CD8 antibodies. (anti CD4-APC and an anti CDBPerCP). After a permeabilization and fixation step, cells were stained with a fluorescent anti IFNg-FITC antibody.

[0216] In mice vaccinated with CPC P501 in different adjuvant, both CD4 and CD8 T cells are shown to produce IFNg in response to DC pulsed with either the immunogen and the C-term p501 made in *E coli* (as shown by intracellular staining of spleen and PBLs). There is an increase of 4-10X in the % of cells making this cytokine in the groups receiving the adjuvanted CPC-P501 S compared to the protein alone, and between 0.1 to 10% of CD4 or CD8 T cells are shown to produce IFNg.

[0217] In conclusion, these data allow to conclude that the adjuvanted CPC-P501 protein is immunogenic in mice. Both a P501 specific humoral and cellular responses including IFNg production by CD4 and CD8 T cells can be detected after several intramuscular vaccination with CPC P501 in adjuvants.

Example X. CPC-MUC-1 constructs and sequences

[0218] CPC sequence is taken from nucleotide SEQ ID NO. 28.

MUC1 sequence is available from Genbank database (accession number NM_002456).

1. MUC1-CPC construct

[0219] Due to the presence of a signal sequence in MUC1 that is cleaved post-translationally, the CPC motif was placed at the C-terminus. The resulting MUC1-CPC DNA sequence is depicted in SEQ ID NO. xx (figure 28A) and the corresponding MUC1-CPC protein sequence in SEQ ID NO. yy (figure 28B).

2. ss-CPC-MUC1 construct

[0220] Due to the presence of a signal sequence in MUC1 that is cleaved post-translationally, the MUC1 signal sequence was replaced by a heterologous leader sequence (from the human immunoglobulin heavy chain) and the CPC motif was inserted between the heterologous leader sequence and the MUC1 sequence, generating a sequence termed ss-CPC-MUC1 as depicted in figure 29

Claims

1. A fusion partner protein comprising a choline binding domain and a heterologous promiscuous T helper epitope.
2. A fusion partner protein according to claim 1 wherein the choline binding domain is the C terminus of LytA or a derivative thereof in which the derivative of the C-terminus of LytA retains both the capability of acting as an immunological partner and an expression enhancer.
3. A fusion partner protein according to claim 2 wherein the C-LytA or derivative thereof comprises at least four repeats of any of SEQ ID NO:1 to 6.
4. A fusion partner protein according to any of claims 1 to 3, wherein the choline binding domain is selected from the group comprising:
 - a) the C-terminal domain of LytA as set forth in SEQ ID NO:7; or
 - b) the sequence of SEQ ID NO:8; or
 - c) a peptide sequence comprising an amino acid sequence having at least 85% identity, preferably at least 90% identity, more preferably at least 95% identity, most preferably at least 97-99% identity, to any of SEQ ID NO: 1 to 6; or
 - d) a peptide sequence comprising an amino acid sequence having at least 15, 20, 30, 40, 50 or 100 contiguous amino acids from the amino acid sequence of SEQ ID NO:7 or SEQ ID NO:8.
5. A fusion protein comprising a fusion partner protein as claimed in any of claims 1 to 4 and a heterologous protein.
6. A fusion protein as claimed in claim 5 wherein the heterologous protein is chemically conjugated to the fusion partner.
7. A fusion protein as claimed in claim 5 or 6 wherein the heterologous protein is derived from an organism selected from the following group: Human Immunodeficiency virus HIV-1, human herpes simplex viruses, cytomegalovirus, Rotavirus, Epstein Barr virus, Varicella Zoster Virus, from a hepatitis virus such as hepatitis B virus, hepatitis A virus, hepatitis C virus and hepatitis E virus, from Respiratory Syncytial virus, parainfluenza virus, measles virus, mumps virus, human papilloma viruses, flaviviruses or Influenza virus, from *Neisseria spp.*, *Moraxella spp.*, *Bordetella spp.*, *Mycobacterium spp.*, including *M. tuberculosis*; *Escherichia spp.*, including *enterotoxigenic E. coli*; *Salmonella spp.*; *Listeria spp.*; *Helicobacter spp.*; *Staphylococcus spp.*, including *S. aureus*, *S. epidermidis*; *Borrelia spp.*; *Chlamydia spp.*, including *C. trachomatis*, *C. pneumoniae*; *Plasmodium spp.*, including *P. falciparum*; *Toxoplasma spp.*, *Candida spp.*
8. A fusion protein as claimed in claim 5 or 6 wherein the heterologous protein is a tumour associated protein or tissue specific protein or immunogenic fragment thereof.
9. A fusion protein as claimed in claim 8 wherein the heterologous protein or fragment thereof is selected from MAGE 1, MAGE 3, MAGE 4, PRAME, BAGE, LAGE 1, LAGE 2, SAGE, HAGE, XAGE, PSA, PAP, PSCA, prostein, P501S, HASH2, Crypto, B726, NY-BR1.1, P510, MUC-1, Prostase, STEAP, tyrosinase, telomerase, survivin, CASB616, P53, or her 2 neu.
10. A fusion protein as claimed in any of claims 6 to 9 further comprising an affinity tag of at least 4 histidine residues.
11. A nucleic acid sequence encoding a protein of claim 1 to 10.
12. An expression vector comprising a nucleic acid sequence of claim 11.
13. A host cell transformed with a nucleic acid sequence of claim 11 or with an expression vector of claim 12.

14. An immunogenic composition comprising a protein as claimed in any of claim 1 to 10 or a DNA sequence as claimed in claim 11 and a pharmaceutically acceptable excipient.
15. An immunogenic composition as claimed in claim 14 which additionally comprises a TH-1 inducing adjuvant.
16. An immunogenic composition as claimed in claim 15 in which the TH-1 inducing adjuvant is selected from the group of adjuvants comprising: 3D-MPL, QS21, a mixture of QS21 and cholesterol, a CpG oligonucleotide or a mixture of two or more of said adjuvants.
17. A process for the preparation of an immunogenic composition as claimed in any of claims 14 to 16, comprising admixing the fusion protein of any of claims 6 to 10 or the encoding polynucleotide of claim 11 with a suitable adjuvant, diluent or other pharmaceutically acceptable carrier.
18. A process for producing a fusion protein of any of claims 1 to 10 comprising culturing a host cell of claim 13 under conditions sufficient for the production of said fusion protein and recovering the fusion protein from the culture medium.
19. A protein of any of claims 1 to 10 or a DNA sequence of claim 11 for use in medicine.
20. Use of a protein as claimed in any of claim 1 to 10 or a DNA sequence of claim 11 in the manufacture of an immunogenic composition for eliciting an immune response in a patient.
21. Use according to claim 20, wherein said immune response is to be elicited by sequential administration of i) the said protein followed by the said DNA sequence; or ii) the said DNA sequence followed by the said protein.
22. Use according to claim 21 wherein said DNA sequence is coated onto biodegradable beads or delivered via a particle bombardment approach.
23. Use according to claim 21 or claim 22 wherein said protein is adjuvanted.
24. Use of a protein as claimed in any of claim 1 to 10 or a DNA sequence of claim 11 in the manufacture of an immunogenic composition for immunotherapeutically treating a patient suffering from or susceptible to cancer.
25. Use according to claim 24 wherein said cancer is prostate cancer, colon cancer, lung cancer, breast cancer or melanoma.

Patentansprüche

1. Fusionspartnerprotein, das eine Cholin-Bindungsdomäne und ein heterologes promiskues T-Helferepitop umfaßt.
2. Fusionspartnerprotein gemäß Anspruch 1, worin die Cholin-Bindungsdomäne der C-Terminus von LytA oder ein Derivat davon ist, wonn das Derivat des C-Terminus von LytA sowohl die Fähigkeit zur Funktion als immunologischer Partner als auch als Expressionsverstärker bewahrt.
3. Fusionspartnerprotein gemäß Anspruch 2, worin das C-LytA oder Derivat davon wenigstens vier Repeats aus einem beliebigen aus SEQ ID NO: 1 bis 6 umfaßt.
4. Fusionspartnerprotein gemäß einem der Ansprüche 1 bis 3, worin die Cholin-Bindungsdomäne aus der Gruppe ausgewählt ist, die folgendes umfaßt:
 - a) die C-terminale Domäne von LytA wie in SEQ ID NO: 7 dargestellt; oder
 - b) die Sequenz von SEQ ID NO: 8; oder
 - c) eine Peptidsequenz, die eine Aminosäuresequenz mit wenigstens 85 % Identität, bevorzugt wenigstens 90 % Identität, besonders bevorzugt wenigstens 95 % Identität, am meisten bevorzugt wenigstens 97-99 % Identität mit einem beliebigen aus SEQ ID NO: 1 bis 6 umfaßt; oder
 - d) eine Peptidsequenz, die eine Aminosäuresequenz mit wenigstens 15, 20, 30, 40, 50 oder 100 zusammenhängenden Aminosäuren aus der Aminosäuresequenz von SEQ ID NO: 7 oder SEQ ID NO: 8 umfaßt.

5. Fusionsprotein, das ein Fusionspartnerprotein gemäß einem der Ansprüche 1 bis 4 und ein heterologes Protein umfaßt.
6. Fusionsprotein gemäß Anspruch 5, worin das heterologe Protein chemisch an den Fusionspartner konjugiert ist.
7. Fusionsprotein gemäß Anspruch 5 oder 6, worin das heterologe Protein aus einem Organismus stammt, der aus der folgenden Gruppe ausgewählt ist: humanes Immundefizienzvirus HIV-1, humane Herpes simplex-Viren, Cytomegalovirus, Rotavirus, Epstein-Barr-Virus, Varicella Zoster-Virus, aus einem Hepatitisvirus wie Hepatitis B-Virus, Hepatitis A-Virus, Hepatitis C-Virus und Hepatitis E-Virus, aus respiratorischem Synzytialvirus, Parainfluenzavirus, Masernvirus, Mumpsvirus, humane Papillomaviren, Flaviviren oder Influenzavirus, aus *Neisseria* spp., *Moraxella* spp., *Bordetella* spp., *Mycobacterium* spp., einschließlich *M. tuberculosis*; *Escherichia* spp., einschließlich enterotoxisches *E. coli*; *Salmonella* spp.; *Listeria* spp.; *Helicobacter* spp.; *Staphylococcus* spp.; einschließlich *S. aureus*, *S. epidermidis*, *Borrelia* spp.; *Chlamydia* spp., einschließlich *C. trachomatis*, *C. pneumoniae*; *Plasmodium* spp., einschließlich *P. falciparum*; *Toxoplasma* spp., *Candida* spp.
8. Fusionsprotein gemäß Anspruch 5 oder 6, worin das heterologe Protein ein Tumor-assoziiertes Protein oder gewebespezifisches Protein oder immunogenes Fragment davon ist.
9. Fusionsprotein gemäß Anspruch 8, worin das heterologe Protein oder Fragment davon ausgewählt ist aus MAGE 1, MAGE 3, MAGE 4, PRAME, BAGE, LAGE 1, LAGE 2, SAGE, HAGE, XAGE, PSA, PAP, PSCA, Prostein, P501S, HASH2, Crip1, B726, NY-BR.1.1, P510, MUC-1, Prostase, STEAP, Tyrosinase, Telomerase, Survivin, CASB616, P53 oder her 2 neu.
10. Fusionsprotein gemäß einem der Ansprüche 6 bis 9, das ferner einen Affinitätsmarker mit wenigstens 4 Histidinresten umfaßt.
11. Nukleinsäuresequenz, die ein Protein gemäß Anspruch 1 bis 10 codiert.
12. Expressionsvektor, der eine Nukleinsäuresequenz gemäß Anspruch 11 umfaßt.
13. Wirtszelle, die mit einer Nukleinsäuresequenz gemäß Anspruch 11 oder mit einem Expressionsvektor gemäß Anspruch 12 transformiert ist.
14. Immunogene Zusammensetzung, die ein Protein gemäß einem der Ansprüche 1 bis 10 oder eine DNA-Sequenz gemäß Anspruch 11 und einen pharmazeutisch akzeptablen Exzipienten umfaßt.
15. Immunogene Zusammensetzung gemäß Anspruch 14, die zusätzlich einen TH-1-induzierenden Hilfsstoff umfaßt.
16. Immunogene Zusammensetzung gemäß Anspruch 15, worin der TH-1-induzierende Hilfsstoff aus der Gruppe von Hilfsstoffen ausgewählt ist, die 3D-MPL, QS21, eine Mischung aus QS21 und Cholesterol, ein CpG-Oligonukleotid oder eine Mischung aus zwei oder mehreren der Hilfsstoffe umfaßt.
17. Verfahren zur Herstellung einer immunogenen Zusammensetzung gemäß einem der Ansprüche 14 bis 16, das das Vermischen des Fusionsproteins gemäß einem der Ansprüche 6 bis 10 oder des codierenden Polynukleotids gemäß Anspruch 11 mit einem geeigneten Hilfsstoff, Verdünnungsmittel oder anderen pharmazeutisch akzeptablen Träger umfaßt.
18. Verfahren zur Herstellung eines Fusionsproteins gemäß einem der Ansprüche 1 bis 10, das das Kultivieren einer Wirtszelle gemäß Anspruch 13 unter Bedingungen, die ausreichend zur Herstellung des Fusionsproteins sind, und das Gewinnen des Fusionsproteins aus dem Kulturmedium umfaßt.
19. Protein gemäß einem der Ansprüche 1 bis 10 oder DNA-Sequenz gemäß Anspruch 11 zur Verwendung in der Medizin.
20. Verwendung eines Proteins gemäß einem der Ansprüche 1 bis 10 oder einer DNA-Sequenz gemäß Anspruch 11 in der Herstellung einer immunogenen Zusammensetzung zum Hervorrufen einer Immunreaktion in einem Patienten.
21. Verwendung gemäß Anspruch 20, worin die Immunreaktion durch aufeinanderfolgende Verabreichung i) des Pro-

teins, gefolgt von der DNA-Sequenz; oder ii) der DNA-Sequenz, gefolgt vom Protein hervorgerufen wird.

22. Verwendung gemäß Anspruch 21, worin die DNA-Sequenz auf biologisch abbaubaren Perlen aufgetragen ist oder über einen Partikelbombardierungsansatz übertragen wird.

23. Verwendung gemäß Anspruch 21 oder 22, worin das Protein mit Hilfsstoff versetzt ist.

24. Verwendung eines Proteins gemäß einem der Ansprüche 1 bis 10 oder einer DNA-Sequenz gemäß Anspruch 11 in der Herstellung einer immunogenen Zusammensetzung zur immuntherapeutischen Behandlung eines Patienten, der an Krebs leidet oder dafür anfällig ist.

25. Verwendung gemäß Anspruch 24, worin der Krebs Prostatakrebs, Darmkrebs, Lungenkrebs, Brustkrebs oder Melanom ist.

Revendications

1. Protéine partenaire de fusion comprenant un domaine de liaison à la choline et un épitope de lymphocyte T auxiliaire multivalent.

2. Protéine partenaire de fusion selon la revendication 1, dans laquelle le domaine de liaison à la choline est l'extrémité C-terminale de LytA ou un dérivé de celle-ci, où le dérivé de l'extrémité C-terminale de LytA conserve la capacité d'agir à la fois en tant que partenaire immunogène et stimulateur de l'expression.

3. Protéine partenaire de fusion selon la revendication 2, dans laquelle le C-LytA ou un dérivé de celle-ci comprend au moins quatre répétitions de l'une quelconque des SEQ ID N° 1 à 6.

4. Protéine partenaire de fusion selon l'une quelconque des revendications 1 à 3, dans laquelle le domaine de liaison à la choline est sélectionné dans le groupe consistant en :

a) le domaine C-terminal de LytA tel que représenté par SEQ ID N° 7 ; ou

b) la séquence de SEQ ID N° 8 ; ou

c) une séquence peptidique comprenant une séquences d'acides aminés ayant au moins 85 % d'identité, de préférence au moins 90 % d'identité, de manière plus préférée au moins 95 % d'identité, et de la manière la plus préférée entre toutes au moins 97-99 % d'identité, avec l'une quelconque des SEQ ID N° 1 à 6 ; ou

d) une séquence peptidique comprenant une séquence d'acides aminés ayant au moins 15, 20, 30, 40, 50 ou 100 acides aminés contigus de la séquence d'acides aminés de SEQ ID N° 7 ou SEQ ID N° 8.

5. Protéine de fusion comprenant une protéine partenaire de fusion selon l'une quelconque des revendications 1 à 4, et une protéine hétérologue.

6. Protéine de fusion selon la revendication 5, dans laquelle la protéine hétérologue est chimiquement conjuguée au partenaire de fusion.

7. Protéine de fusion selon la revendication 5 ou 6, dans laquelle la protéine hétérologue est dérivée d'un organisme sélectionné dans le groupe suivant: virus de l'immunodéficience humaine HIV-1, virus herpès simplex humains, cytomégalovirus, rotavirus, virus d'Epstein-Barr, virus varicelle-zona, à partir d'un virus de l'hépatite tel que le virus de l'hépatite B, virus de l'hépatite A, virus de l'hépatite C et virus de l'hépatite E, à partir d'un virus respiratoire syncytial, virus parainfluenza, virus de la rougeole, virus des oreillons, des virus du papillome humain, des flavivirus ou virus de la grippe, à partir des espèces *Neisseria*, espèces *Moraxella*, espèces *Bordetella* ; espèces *Mycobacterium*, comprenant *M. tuberculosis*; des espèces *Escherichia*, comprenant *E. coli* entérotoxique; espèces *Salmonella*; espèces *Listeria*; espèces *Helicobacter*; espèces *Staphylococcus*; comprenant *S. aureus*, *S. epidermidis* ; espèces *Borrelia* ; espèces *Chlamydia*, comprenant *C. trachomatis*, *C. pneumoniae*; espèces *Plasmodium*, comprenant *P. falciparum* ; espèces *Toxoplasma*, espèces *Candida*.

8. Protéine de fusion selon la revendication 5 ou 6, dans laquelle la protéine hétérologue est une protéine associée à une tumeur ou une protéine spécifique à un tissu ou un fragment immunogène de celle-ci.

9. Protéine de fusion selon la revendication 8, dans laquelle la protéine hétérologue, ou un fragment de celle-ci, est sélectionnée parmi MAGE 1, MAGE 3, MAGE 4, PRAME, BAGE, LAGE 1, LAGE 2, SAGE, HAGE, XAGE, PSA, PAP, PSMA, protéine, P501S, HASH2, Cripto, B726, NY-BR1 1, P510, MUC-1, Prostase, STEAP, tyrosinase, télomérase, survivine, CASB616, P53, ou her 2 neu.
10. Protéine de fusion selon l'une quelconque des revendications 6 à 9 comprenant en outre un marqueur d'affinité d'au moins 4 résidus histidine.
11. Séquence d'acide nucléique codant pour une protéine selon la revendication 1 à 10.
12. Vecteur d'expression comprenant une séquence d'acide nucléique selon la revendication 11.
13. Cellule hôte transformée avec une séquence d'acide nucléique selon la revendication 11 ou avec un vecteur d'expression selon la revendication 12.
14. Composition immunogène comprenant une protéine selon l'une quelconque des revendications 1 à 10 ou une séquence ADN selon la revendication 11 et un excipient pharmaceutiquement acceptable.
15. Composition immunogène selon la revendication 14 qui comprend en outre un adjuvant induisant TH-1.
16. Composition immunogène selon la revendication 15, dans laquelle l'adjuvant induisant TH-1 est sélectionné parmi le groupe d'adjuvants comprenant : 3D-MPL, QS21, un mélange de QS21 et de cholestérol, un oligonucléotide CpG ou un mélange de deux ou plusieurs desdits adjuvants.
17. Procédé pour la préparation d'une composition immunogène selon l'une quelconque des revendications 14 à 16, comprenant un mélange de la protéine de fusion selon l'une quelconque des revendications 6 à 10, ou du polynucléotide codant selon la revendication 11, avec un adjuvant approprié, un diluant ou autre transporteur pharmaceutiquement acceptable.
18. Procédé de production d'une protéine de fusion selon l'une quelconque des revendications 1 à 10 comprenant la mise en culture d'une cellule hôte selon la revendication 13 dans des conditions suffisantes pour produire ladite protéine de fusion et récupérer la protéine de fusion dans le milieu de culture.
19. Protéine selon l'une quelconque des revendications 1 à 10 ou une séquence ADN selon la revendication 11 destinée à une utilisation en médecine.
20. Utilisation d'une protéine selon l'une quelconque des revendications 1 à 10 ou une séquence ADN selon la revendication 11 dans la fabrication d'une composition immunogène pour provoquer une réponse immunitaire chez un patient.
21. Utilisation selon la revendication 20, dans laquelle ladite réponse immunitaire doit être provoquée par une administration séquentielle de i) ladite protéine suivie par ladite séquence ADN ; ou ii) ladite séquence ADN suivie par ladite protéine.
22. Utilisation selon la revendication 21, dans laquelle ladite séquence ADN est enrobée sur des microsphères biodégradables ou est délivrée par une approche de bombardement particulaire.
23. Utilisation selon la revendication 21 ou la revendication 22, dans laquelle ladite protéine est associée à un adjuvant.
24. Utilisation d'une protéine selon l'une quelconque des revendications 1 à 10 ou une séquence ADN selon la revendication 11 dans la fabrication d'une composition immunogène pour un traitement d'immunothérapie chez un patient présentant un cancer ou étant susceptible de présenter un cancer.
25. Utilisation selon la revendication 24, dans laquelle ledit cancer est le cancer de la prostate, le cancer du côlon, le cancer du sein ou le mélanome.

↓	
Centrifugation	12.000 g / RT / 90 min (supernatant discarded)
↓	
Pellet washing step 1	20 mM Tris pH 8.5 - 0.15 M NaCl - 2.0 M Guanidine.HCl - 0.1% Empigen (30 min / RT)
↓	
Centrifugation	12.000 g / RT / 60 min (supernatant discarded)
↓	
Pellet washing step 2	20 mM Tris pH 8.5 - 0.15 M NaCl - 4.0 M Urea
↓	
Centrifugation	12.000 g / RT / 30 min (supernatant discarded)
↓	
Solubilisation / Reduction	20 mM Tris pH 8.5 - 0.15 M NaCl - 8.0 M Urea - 1% SDS - 0.2 M Glutathion (60 min / RT)
↓	
Centrifugation	12.000 g / RT / 30 min (pellet discarded)
↓	
Carbamidomethylation	0.3 M Iodoacetamide (30 min / RT / in the dark) / pH adjusted to 8.5 (with 5 M NaOH solution) before incubation
↓	
R/C Supernatant	
↓	
10-fold dilution and pH adjustment (8.5)	<u>Dilution buffer</u> : 20 mM Tris pH 8.5 - 1 M NaCl - 8.0 M Urea
↓	
Immobilised metal ion affinity chromatography on Ni²⁺-Chelating Sepharose FF (Amersham) (10x25 cm column – 2000 ml)	<u>Equilibration buffer</u> : 20 mM Tris pH 8.5 - 0.9 M NaCl - 8.0 M Urea - 0.1% SDS <u>Washing buffers</u> : 1) Equilibration buffer 2) 20 mM Tris pH 8.5 - 0.15 M NaCl - 8.0 M Urea - 0.1% SDS 3) 20 mM Tris pH 8.5 - 8.0 M Urea - 0.1% Tween 80

	<u>Elution buffer:</u> 20 mM Tris pH 8.5 - 8.0 M Urea - 0.1% Tween 80 - 0.5 M Imidazole
↓	
2-fold dilution and pH adjustment (10.0)	20 mM Piperazine pH 10.0 - 8.0 M Urea - 0.1% Tween 80
↓	
Anion exchange chromatography on Q Sephacrose FF (Amersham) (2,6 x 6.5 cm column - 35 ml)	<u>Equilibration buffer:</u> 20 mM Piperazine pH 10.0 - 8.0 M Urea - 0.1% Tween 80 <u>Washing buffers:</u> 1) Equilibration buffer 2) 20 mM Tris pH 8.5 - 8.0 M Urea - 0.1% Tween 80 <u>Elution buffer:</u> 20 mM Tris pH 7.5 - 8.0 M Urea - 0.1% Tween 80 - 0.5 M NaCl
↓	
Concentration/Diafiltration (Pall - Omega 10 kDa - 200 cm²)	+/- 3-fold concentration <u>Diafiltration buffer:</u> Tris 20 mM pH 7.5
↓	
Sterile filtration (Millipore - Millex GV 0.22µm)	
↓	
Purified bulk	<u>Final buffer:</u> 20 mM Tris pH 7.5 - +/- 0.3% Tween 80
↓	
Storage -20°C	

FIG. 11. Pattern of CPC P501 His purified protein (4-12% Novex Nu-Page polyacrylamide precasted gels)

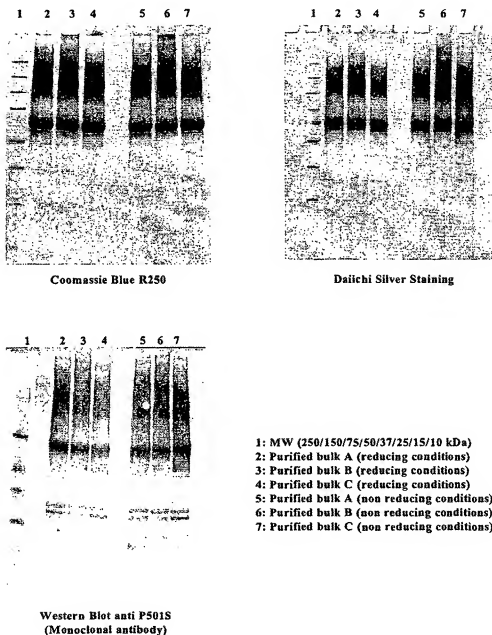

FIG. 12. Native full-length P501S sequence (SEQ ID NO:17 & 43)

Nucleotide sequence: SEQ ID NO.17

Polypeptide sequence: SEQ ID NO.43

FIG. 21 – Western blot analysis of CHO cells following transient transfection with P501S (JNW680), CPC-P501S (JNW735) and empty vector control.

FIG. 22 – Anti-P501S antibody responses following immunisation at day0, 21 & 42 with pVAC-P501S (JNW680, mice B1-9) or Empty vector (pVAC, mice A1-6).

FIG. 23 – Peptide library screen using C57BL/6 mice immunised at day 0, 21, 42, and 70 with pVAC-P501S (JNW680).

FIG. 24 – Cellular responses by ELISPOT at day 77 following PMID immunisation at day 0, 21, 42, and 70 with pVAC-P501S (JNW680, B6-9) and pVAC empty (A4-6).

Graph A shows the IFN- γ responses whilst Graph B shows the IL-2 responses.

FIG. 25 – Comparison of P501S and CPC-P501S.

FIG. 26 – Immune response (lymphoproliferation on spleen cells) following protein immunisation with CPC-P501S.

FIG. 27 – Evaluation of the immune response to different CPC-P501S constructs

FIG. 28. MUC1-CPC DNA and polypeptide sequences**FIG. 28A. DNA sequence (SEQ ID NO.49)**
